Television tuners

Coaxial aerial input assemblies
DATA HANDBOOK SYSTEM
DATA HANDBOOK SYSTEM

Our Data Handbook System comprises more than 60 books with specifications on electronic components, subassemblies and materials. It is made up of four series of handbooks:

ELECTRON TUBES  BLUE

SEMICONDUCTORS  RED

INTEGRATED CIRCUITS  PURPLE

COMPONENTS AND MATERIALS  GREEN

The contents of each series are listed on pages iv to vii.
The data handbooks contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

When ratings or specifications differ from those published in the preceding edition they are indicated with arrows in the page margin. Where application information is given it is advisory and does not form part of the product specification.

Condensed data on the preferred products of Philips Electronic Components and Materials Division is given in our Preferred Type Range catalogue (issued annually).

Information on current Data Handbooks and on how to obtain a subscription for future issues is available from any of the Organizations listed on the back cover.

Product specialists are at your service and enquiries will be answered promptly.
ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks comprises:

T1    Tubes for r.f. heating
T2a   Transmitting tubes for communications, glass types
T2b   Transmitting tubes for communications, ceramic types
T3    Klystrons
T4    Magnetrons for microwave heating
T5    Cathode-ray tubes
      Instrument tubes, monitor and display tubes, C.R. tubes for special applications
T6    Geiger-Müller tubes
T8    Colour display systems
      Colour TV picture tubes, colour data graphic display tube assemblies, deflection units
T9    Photo and electron multipliers
T10   Plumbicon camera tubes and accessories
T11   Microwave semiconductors and components
T12   Vidicon and Newvicon camera tubes
T13   Image intensifiers and infrared detectors
T15   Dry reed switches
T16   Monochrome tubes and deflection units
      Black and white TV picture tubes, monochrome data graphic display tubes, deflection units
SEMICONDUCTORS (RED SERIES)

The red series of data handbooks comprises:

S1  Diodes
    Small-signal silicon diodes, voltage regulator diodes (< 1,5 W), voltage reference diodes,
    tuner diodes, rectifier diodes

S2a  Power diodes

S2b  Thyristors and triacs

S3  Small-signal transistors

S4a  Low-frequency power transistors and hybrid modules

S4b  High-voltage and switching power transistors

S5  Field-effect transistors

S6  R.F. power transistors and modules

S7  Surface mounted semiconductors

S8a  Light-emitting diodes

S8b  Devices for optoelectronics
    Optocouplers, photosensitive diodes and transistors, infrared light-emitting diodes and
    infrared sensitive devices, laser and fibre-optic components

S9  Power MOS transistors

S10  Wideband transistors and wideband hybrid IC modules

S11  Microwave transistors

S12  Surface acoustic wave devices

S13  Semiconductor sensors

S14  Liquid Crystal Displays
INTEGRATED CIRCUITS (PURPLE SERIES)

The purple series of handbooks comprises:

COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks comprises:

C2  Television tuners, coaxial aerial input assemblies
C3  Loudspeakers
C4  Ferroxcube potcores, square cores and cross cores
C5  Ferroxcube for power, audio/video and accelerators
C6  Synchronous motors and gearboxes
C7  Variable capacitors
C8  Variable mains transformers
C9  Piezoelectric quartz devices
C11 Varistors, thermistors and sensors
C12 Potentiometers, encoders and switches
C13 Fixed resistors
C14 Electrolytic and solid capacitors
C15 Ceramic capacitors
C16 Permanent magnet materials
C17 Stepping motors and associated electronics
C18 Direct current motors
C19 Piezoelectric ceramics
C20 Wire-wound components for TVs and monitors
C22 Film capacitors

* These assemblies comply with the requirements of immunity from radiated interference of Amtsblatt DBP69/1981.

** This assembly complies with the requirements of immunity from radiated interference of BS905.
Pin Compatibility

All tuners of our 600-series and 700-series, and the tuner parts of our 600-series front-ends are pin-compatible, i.e. the pins for the same function are situated at the same place. However, the position of the mounting tab at the aerial input side of the tuners in the 700-series (MT4) is different, because these tuners are smaller. For this reason these tuners are also available with a longer aerial connector for interchangeability purposes. The front-ends have an extra mounting tab (MT3).

**Fig. 6.**

**Terminal**

A = aerial input connector
5 = a.g.c. voltage
6 = supply voltage, +12 V
7 = supply voltage, low v.h.f., +12 V
8 = supply voltage, high v.h.f., +12 V
9 = supply voltage, hyperband, +12 V
10 = supply voltage, u.h.f., +12 V
11 = tuning voltage
12 = supply voltage, frequency divider, +5 V
13, 14 = balanced output voltage of frequency divider
15 = earth
16 = i.f. output
17 = i.f. output (UV tuners)

**Mounting tabs**

600-series tuners: MT1, MT2
700-series tuners: MT4, MT2
600-series front ends: MT1, MT2, MT3

APPLICATION

Designed to cover the v.h.f. channels of C.C.I.R. systems M and N (R.T.M.A.). Thanks to its good signal-handling properties, the tuner is especially suited for strong signal areas.
DESCRIPTION

The ELC3082 is a v.h.f. tuner with electronic tuning and band switching, covering the low v.h.f. band (frequency range 54 to 88 MHz) and the high v.h.f. band (frequency range 174 to 216 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The aerial connection is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages) are made via terminals in the under side. The mounting method is shown in Figs 3 and 4.

Electrically, the tuner consists of v.h.f. and i.f. parts. The aerial signal is fed to the input filters, providing i.f. rejection and band selection. The filters are followed by a P-I-N diode attenuator, equipped with two diodes BA379. The output of the attenuator is connected to the emitter of the input transistor BF480, operating as r.f. amplifier in grounded base configuration. The same transistor also delivers the current drive for the P-I-N diode attenuator, controlled by an a.g.c. voltage fed to the transistor base. The combination of the diode attenuator with this high current transistor (\( I_E \) at normal gain about 10 mA) has excellent signal-handling properties within the whole a.g.c. range.

The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the emitter of the mixer transistor BF324. Good signal-handling properties of this stage are achieved by high oscillator injection. The oscillator is equipped with a transistor BF324. In the low v.h.f. position, self-detection of the oscillator signal is used to back-bias the five switching diodes BA482/483/484, required for band switching between low and high v.h.f. channels. Three capacitance diodes BB809 provide tuning of the r.f. circuits. The collector of the mixer transistor is connected to a single tuned i.f. resonant circuit (about 20 MHz bandwidth), the output of which is fed to the i.f. output stage, equipped with another transistor BF324 in grounded base configuration. This stage has also been designed especially for good signal-handling properties. The collector load of the i.f. output transistor is formed by a single tuned i.f. circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner.

The tuner can be used in combination with a u.h.f. tuner. In this case the u.h.f. i.f. signal is fed to the emitter of the i.f. output transistor, which acts as i.f. amplifier for u.h.f. as well as for v.h.f.

The u.h.f. i.f. input terminal can be used as an i.f. injection point for aligning the i.f. output circuit together with the i.f. amplifier of the television receiver. For the same purpose a separate i.f. injection point has been provided at the collector of the mixer.

The tuner requires transistor supply voltages of +12 V, a switching voltage of +12 V, a.g.c. voltages, variable from +5 V (normal operating point) to about +2,5 V (maximum a.g.c.) and a tuning voltage, variable from +0,5 V to +28 V.

The aerial input of the tuner is asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORY).

E = earth
Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.)

The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

Fig. 3 Piercing diagram viewed from solder side of board: $e = 2.54$ mm (0.1 in).

Fig. 4 Recommended fixing method of the aerial cable. Use a self-tapping screw.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C and a supply voltage of 12 ± 0,3 V.

Notes — At 40 dB gain reduction the currents decrease about 5 mA.

The supply voltage at terminal 4 should be carefully filtered to avoid hum modulation in one of the P-I-N diodes when the attenuator is biased to higher attenuation ratios. Under most unfavourable conditions a ripple voltage of 3 mV (p-p) may produce a disturbance which is just visible.

Signal handling
- Minimum input signal (e.m.f.) producing cross-modulation (1%) in channel:
  - wanted signal: picture carrier frequency
  - interfering signal: sound carrier frequency in band
  - minimum input signal (e.m.f.) producing cross-modulation (1%)
  - in channel:
    - wanted signal: picture carrier frequency of channel N.
    - interfering signal: picture carrier of channel N ± 2
    - interfering signal: picture carrier of channel > N ± 3
- Minimum input signal (e.m.f.) producing overloading, at nominal gain, at maximum a.g.c.
  - low band: typ. 50 mV
  - high band: typ. > 500 mV
- Minimum input signal (e.m.f.) at nominal gain producing a shift of the oscillator frequency of 10 kHz,
  - low band: typ. 50 mV
  - high band: typ. 30 mV
- Detuning of the i.f. output circuit as a result of band switching and tuning: max. 150 kHz
- Shift of oscillator frequency at a change of the supply voltage of 5%:
  - low band: max. 300 kHz
  - high band: max. 300 kHz
- during warm-up time (measured between 5 s and 15 min after switching on):
  - low band: max. 150 kHz
  - high band: max. 150 kHz

* This e.m.f. (open voltage) is referred to an impedance of 75 Ω.
1% cross-modulation means that 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

** This e.m.f. (open voltage) is referred to an impedance of 75 Ω.
Criterion of overloading: 30% compression of the synchronization pulses of a standard television signal or a noticeable deterioration of the picture quality.

▲ This e.m.f. (open voltage) is referred to an impedance of 75 Ω.
Drift of oscillator frequency
at a change of the ambient temperature from 25 to 50 °C

- 25 to 50 °C
  - low band max. 500 kHz
  - high band max. 500 kHz

Oscillator radiation
The tuner is in conformity with the radiation requirements of C.I.S.P.R. Recommendation No. 24/2 and the corresponding F.C.C. rules, provided the tuner is installed in a professional manner.

Microphonics
If the tuner is installed in a professional manner, there will be no microphonics.

Surge protection
Protection against voltages max. 5 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.
ALIGNMENT OF THE I.F. CIRCUIT

For i.f. injection the u.h.f. i.f. input (terminal 1) or the i.f. injection point at the collector of the mixer transistor (at the top of the tuner, Fig. 2) can be used. The aligning can be done with any channel tuned. A probe as shown in Fig. 9 should be used.

![Diagram of IF Generator](Attachment)

The signal attenuation between the i.f. generator and the i.f. output of the tuner is about 4 dB when injection is done via the injection point, and about 8.5 dB in the case of injection via the u.h.f. i.f. input. The i.f. output circuit is detuned about +300 kHz* or -150 kHz* when injection is done via the injection point or via the u.h.f. i.f. input respectively.

MEASURING METHOD OF POWER GAIN

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

![Diagram of Measuring Method](Attachment)

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 43.5 MHz. The bandwidth should be approx. 4.5 MHz.

Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

* Reference: normal operation with r.f. signal via aerial input.

### APPLICATION

Designed to cover the tuner function according to the C.C.I.R. systems B, G and H with extended v.h.f. frequency ranges, combined with a quasi split sound i.f. function to demodulate the video signal and to convert the sound signal.

The tuner part of the FE618Q(M)/256 is equipped with a frequency divider, which makes it suitable for digital tuning systems based on frequency synthesis; for the remainder it is equal to type FE617Q(M).

These types comply with the requirements of radiation, signal handling capability, and immunity from radiated interference of Amtsblatt DBP69/1961, and for Finland E.I.S. bulletin T33-82, section 4, when installed professionally in an adequate TV receiver.
Fig. 1 Tuner part.

For types FE617Q and QM delete: C71, C72, C86, C87, C88, R71, R72, IC2.

For connections see Fig. 3.
For connections see Fig. 3.
DESCRIPTION

The front ends contain v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the low v.h.f. band (frequency range 46 to 110 MHz), the high v.h.f. band (frequency range 111 to 300 MHz), and the u.h.f. band (frequency range 470 to 860 MHz).

Mechanically, the front ends consist of a tuner part and an i.f. part built on separate low-loss printed-wiring boards, carrying all components, in a housing made of a rectangular diecast metal frame and front and rear covers (see Fig. 3). The common IEC coaxial aerial connector (75 Ω) is integrated in one of the frame sides of the housing, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 4.

Electrically, the tuner part consists of v.h.f. and u.h.f. parts (see Fig. 1). They are equipped with a common aerial input and provided with r.f. MOSFET input stages. The v.h.f. mixer, v.h.f. oscillator and i.f. amplifier functions are provided by a tuner IC. This IC has terminals between mixer and i.f. amplifier to connect the i.f. preselection.

The r.f. band pass filter and oscillator circuits are tuned by 7 tuning diodes; band switching is achieved by 4 switching diodes.

The u.h.f. part of the tuner has a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the i.f. pre-amplifier of the tuner I.C.

The r.f. band pass filter and oscillator circuits are tuned by 4 tuning diodes.

In all bands the tuner is gain-controlled via gate 2 of the input MOSFET tetrode.

A test point TP1 is provided for i.f. injection.

The electrical circuit of the FE618Q(M)256 is extended with a frequency divider (division ratio of 256), with inputs connected to the v.h.f. and u.h.f. oscillators. The symmetrical ECL outputs are connected to terminals 13 and 14.

The i.f. part is of the quasi-split sound type. It has separate ICs for video demodulation and sound conversion (see Fig. 2).

The demodulated (CVBS-) video signal is available at the video output of the front end and the converted sound signal, with intercarrier frequencies of 5.50 MHz and 5.74 MHz, is available at the sound output.

In the i.f. part of the QM versions a video identification signal is also generated. This can be used to mute the sound in case of "no video" and is available at the video identification output.

Terminal designations in Fig. 3

Mass approx. 160 g

Mounting

The unit may be mounted by soldering it on to a printed-wiring board (using the piercing diagram shown in Fig. 4). The construction and positioning of the 3 mounting tags is such that a ‘click’ indicates the correct seating of the unit on the printed-wiring board. The unit may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tags is according to IEC 68-2, test Ta (235 ± 5 °C, 2 ± 0.5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

\[
\begin{align*}
\varnothing 2.8 \text{ min} & \quad 5 \text{ min} \\
\end{align*}
\]

(1) Only for FE618Q/256 and FE618QM/256 1 eb = 0.025 inch

Fig. 4 Piercing diagram viewed from solder side of board. Unless otherwise stated the tolerance is ± 0.05 mm.

In order to withstand vibrations, shocks and bumps that could damage the solder joints of the mounting tags, the front end should be mounted and soldered without clearance between the supporting area and the printed-wiring board.

This can be achieved by:
- twisting the mounting tags 18° (-3°); or
- pressing the front end against the printed-wiring board during soldering; or
- supporting the front end at its aerial connector.

If the aerial connector is used as a direct input to the television set, it should be supported to prevent the printed-wiring board from stress.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5°C, a relative humidity of 60 ± 15%, supply and band switching voltages of 12 ± 0.3 V.

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of R.T.M.A. systems M and N.

The tuner is provided with a frequency divider (1 : 256 or 1 : 64), which makes it suitable for digital tuning systems based on frequency synthesis.

DESCRIPTION

The M34 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching, covering the low v.h.f. band (frequency range 54 to 88 MHz), the high v.h.f. band (frequency range 174 to 216 MHz), and the u.h.f. bands (frequency range 470 to 890 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common coaxial phono aerial connector (75 Ohm) is on one of the frame sides. The coaxial i.f. output is at the top. All other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, prescaler outputs) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuner comprises v.h.f. and u.h.f. parts (see Fig. 1). The v.h.f. aerial signal is fed via switchable low and high v.h.f. tuned input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge).

The input filters are provided with an i.f. and f.m. suppression circuit. The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit. The i.f. signal is coupled out via an additional i.f. amplifier. A test point (T.P.) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver.

The test point is accessible through a hole in the top of the tuner and is connected to the collector of the mixer transistor.

The single tuned input, the r.f. band pass filter and oscillator circuits are tuned by 4 tuning diodes; band switching is achieved by 5 switching diodes.

The u.h.f. part of the tuner consists of a single tuned input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode.

The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The r.f. bandpass filter and oscillator circuits are tuned by 3 tuning diodes.

In all bands the tuner is gain-controlled via gate 2 of the input MOSFET tetrode.

The electrical circuit contains a frequency divider (division ratio 256 or 64), with inputs from the v.h.f. and u.h.f. oscillators. The complementary outputs are connected to terminals 12 and 13.

14 = i.f. output
V.H.F./U.H.F. television tuners

Mass approx. 125 g

Mounting

1.14 mm (0.045 in) square pins of the Molex 2161 series must be inserted in holes with a diameter of 1.5 mm in a printed-wiring board of which the piercing diagram is given in Fig. 3. Pins in holes marked A are to protect the tuner against reversed mounting. Height of the pins above the component side of the board should be 10 ± 1 mm.

The tuner can be mounted anywhere in the receiver and fixed by means of bolts and nuts, e.g. M5. There are no restrictions on orientation.

Marking

The tuner is provided with a label, stuck on the top face, on which the following data are printed:

- type number M34
- catalogue number
- letter code for origin
- change code
- data code (year and week), a belt number can be added.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, an air pressure of 86 to 106 kPa, a supply voltage of 12 ± 0,3 V and an a.g.c. voltage of 10 ± 0,2 V.

Protection against voltages max. 5 kV
Note: 10 discharges of a 470 pF capacitor into the aerial terminal.
Protection against flashes max. 30 kV, 400 mWs
Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

I.F. injection
The test point (T.P.) connected to the collector of the v.h.f. mixer transistor can be used for i.f. injection via a capacitance of 0,3 pF.
The tuner can be switched to either a v.h.f. or a u.h.f. band, with a tuning voltage of at least 5 V.
Attenuation of injected signal is 20 dB.

Connection of the i.f. amplifier
No special precautions are required to load and to match the i.f. output of the tuner.

Connection of supply voltages

![Connection of supply voltages diagram]

Fig. 13.
Method of measuring power gain

The i.f. output of the tuner should be terminated with 75 $\Omega$.

No further i.f. alignment is necessary.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 47680.

APPLICATION

These tuners are for use in u.h.f. single-standard receivers. In combination with v.h.f. tuner V317 or V334 they can be used in v.h.f./u.h.f. receivers.

The tuners meet the special requirements of the United Kingdom.

The U341LO Mark 2 is a special version of the U341 Mark 2; an output voltage sample from the local oscillator is available for driving digital tuning systems. Apart from this the tuners are identical.

The tuners are pin-compatible with tuners U341 and U341LO; the a.g.c. circuit is voltage driven.
DESCRIPTION
These are u.h.f. tuners with electronic tuning, covering the u.h.f. band from 470 to 860 MHz (channels E21 to E69). The tuner circuit is built on a printed-wiring board and enclosed in a metal housing comprising a rectangular frame and front and rear covers (see Fig.2a). The shielded aerial connection is on one of the shortest frame sides, all other connections (supply voltages, a.g.c., tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Figs.3 and 4.

Tuner U341LO Mark 2 has a coaxial socket on the top of the frame for the oscillator output sample. Electrically, the tuners consist of an input circuit with a high-pass characteristic and a MOS-FET tetrode BF980. This tetrode operates at a drain current of about 10 mA, and has good noise figures and signal handling properties. It also acts as an a.g.c. device, controlled by an a.g.c. voltage fed to gate 2. This combination has good signal handling properties throughout the a.g.c. range. The drain load of the MOS-FET tetrode is formed by a double tuned circuit which transfers the signal to the mixer diode 1SS99. The selectivity of this circuit at the image frequency has been improved by special means. The mixer diode is driven by an oscillator transistor BF970. For the U341LO Mark 2 the oscillator sample is fed out of the oscillator via a resistor.

The i.f. signal, from the mixer is amplified by a transistor BF324 in grounded-base configuration. The combination of the Schottky-barrier diode 1SS99 and the i.f. transistor BF324 ensures good noise figures and signal handling properties. Three capacitance diodes OF643 tune the double tuned circuit and the oscillator.

The i.f. output circuit is single tuned with output coupling from the low impedance side. A d.c. path to earth for the collector current of the i.f. transistor BF324 must be provided outside the tuner, preferably by a choke of about 5 µH. Damping of the i.f. output circuit and matching to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point is provided at the collector of the i.f. transistor, connected to terminal 7. U341LO Mark 2 has a special connection to provide an oscillator output for driving digital tuning systems.
MECHANICAL DATA

Dimensions in mm

Fig. 2a The oscillator sample socket, drawn with dotted lines, applies only to tuner U341 LO Mark 2.

Terminal 1 = aerial connection
2 = r.f. supply voltage, +12 V
3 = a.g.c. voltage, +9.2 to +1 V
4 = tuning voltage, +1 to +28 V
6 = oscillator/i.f. supply voltage, +12 V
7 = i.f. injection point
10 = i.f. output

Note: When the tuner is operated together with a v.h.f. tuner, only the supply voltage at terminal 6 should be switched off during v.h.f. operation.

Fig. 2b I.F. output coil.
Torque for alignment: 2 to 15 mNm
Press-through force: ≥ 10 N

Mass approx. 75 g
Mounting

The tuner may be mounted by soldering it on to a printed wiring board with connections as shown by the piercing diagram in Fig. 3. (The tuner may also be mounted in a socket. See under accessories. It is recommended that the tuner be installed in a cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta (230 ± 10 °C, 2 ± 0.5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

![Fig.3 Piercing diagram viewed from solder side of board](image)

A coaxial plug has to be used for connection to the socket on the top of tuner U341LO Mark 2; type 3/2 50 (manufacturer: Daut und Rietz) is recommended. (See under accessories).

The aerial cable should be connected as follows:

- strip the cable according to Fig. 4B;
- fix the cable as indicated in Fig. 4 C and solder the inner conductor on the aerial tag;
- insert the lugs on immunity shield under the tabs on tuner body, push the shield into position so that the locating tags snap into place in the tuner body.

![Fig.4 Fixing of the aerial cable](image)

Recommended cable: DAVU wire CX4004 (outer sheath diameter 5.32 mm).
ELECTRICAL DATA

The electrical values are measured on the u.h.f. tuner alone, but they are also valid for the u.h.f. tuner when used with a v.h.f. tuner V317 or V334, Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0.3 V and an a.g.c. voltage of 9.2 ± 0.2 V.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

Ambient temperature range

- operating: -10 to + 60 °C
- storage: -25 to + 85 °C

Relative humidity: max. 90%

Voltages and currents

Supply voltage: +12 V ± 10%

Note: The supply voltage at terminal 2 (input stage) should be filtered to avoid hum modulation.

Ripple susceptibility

Defined as the peak-to-peak value of a sine wave signal (20 Hz — 500 kHz) on the supply voltages causing an amplitude modulation with a modulation depth of 0.28% on the picture carrier after passing the Nyquist curve of the i.f. filter of a tv receiver.

ripple susceptibility: min. 3 mV peak-to-peak

Current drawn from +12 V supply

- r.f. amplifier, at nominal gain: typ. < 21 mA
- r.f. amplifier, at 30 dB gain reduction: typ. 11 mA
- oscillator/i.f. amplifier: max. < 16 mA

A.G.C. voltage (Fig.5)

- voltage at nominal gain: + 9.2 ± 0.5 V
- voltage at 30 dB gain reduction: min. + 1 V

Note: A.G.C. voltages between 0 and + 10 V may be applied without risk of damage.

A.G.C. current (Fig.5)

- during gain control (0 to 30 dB): max. + 1 mA
- at nominal gain: typ. + 0.9 mA
- at 30 dB gain reduction: typ. + 0.1 mA
Tuning voltage range (Fig.6) + 1 to + 28 V

Current drawn from + 28 V tuning voltage supply
- at 25 °C max. 0.15 µA
- at 55 °C max. 0.6 µA

Slope of tuning characteristic min. 4 MHz/V

Note: The source impedance of the tuning voltage offered to terminal 4 must be maximum 47 kΩ at tuning voltages below 3 V.

Oscillator sample signal; only valid for U341LO Mark 2
- at + 12 V supply voltage and typ. 90 dB (µV) into 75 Ω
- T_{amb} = + 25 °C
- within the given tolerance range of supply voltage and given operating temperature range, min. 80 dB (µV) into 75 Ω
- and within the tuning voltage range + 0.5 to + 30 V max. 105 dB (µV) into 75 Ω

Note: A tuning voltage higher than + 28 V will not damage the tuner and may be applied at the user’s own risk. Under this condition the published reverse voltage limit of the oscillator tuning diode will be exceeded; the oscillator frequency will never decrease with increasing tuning voltage.
**Frequencies**

**Frequency range**
channel E21 (picture carrier 471.25 MHz) to channel E69 (picture carrier 855.25 MHz). Margin at the extreme channels: min. 3 MHz.

**Intermediate frequencies**

The oscillator frequency is higher than the aerial signal frequency.

**Note:** The tuner is aligned in such a way that the i.f. frequencies of the four systems can be applied.

**Wanted signal characteristics**

**Input impedance**
- asymmetrical: 75 Ω

**Output impedance at the oscillator sample socket; only valid for U341LO Mark 2**
- asymmetrical: 75 Ω

**V.S.W.R. and reflection coefficient**
- at picture carrier frequency, at nominal gain and at 30 dB gain reduction
  - v.s.w.r.: max. 6
  - reflection coefficient: max. 71%

**V.S.W.R. and reflection coefficient* at oscillator sample socket; only valid for U341LO Mark 2**
- v.s.w.r. at f_{osc} 80 MHz – 900 MHz: max. 3.5
- reflection coefficient at f_{osc} 80 MHz – 900 MHz: max. 56%

**R.F. curves, bandwidth**
typ. 20 MHz

**R.F. curves, tilt (only for i.f. 39.5/33.5 MHz)**
on any channel the amplitude difference between the top of the r.f. resonant curve and the picture frequency, the sound frequency, or any frequency between them will not exceed 3 dB at nominal gain, and 4 dB in the a.g.c. range between nominal gain and 20 dB gain reduction.

**A.G.C. range**
min. 30 dB

*Measured in operational and non-operational condition of the tuner.*
U.H.F. television tuners

**Power gain (see also Measuring method of power gain)**
- channel E21: min. 20 dB, typ. 27 dB
- channel E40: min. 20 dB, typ. 25 dB
- channel E69: min. 20 dB, typ. 27 dB

**Gain difference between any two channels**
- typ. 4 dB

**Noise figure**
- channel E21: max. 10 dB, typ. 5.5 dB
- channel E40: typ. 6.5 dB
- channel E69: typ. 7 dB

**Overloading**
- Input signal producing 1 dB gain compression at nominal gain: typ. 90 dB (µV) into 75 Ω
- Input signal producing either a detuning of the oscillator of +300 kHz or -1000 kHz or stopping of the oscillations at nominal gain: typ. 100 dB (µV) into 75 Ω

**1.6 MHz moiré rejection (for i.f. 39.5/33.5 MHz)**

**Wanted signal level of a tv signal (picture to sound ratio of 7 dB and picture to chroma ratio of 16 dB), produces an unwanted i.f. component (37.8 MHz) 52 dB below the i.f. picture carrier, when the tuner is 30 dB gain controlled. I.F. output circuit should be loaded and tuned to 36.15 MHz.**

- tv signal (picture carrier): typ. 100 dB (µV)

**Unwanted signal characteristics**

**Image rejection (measured at picture carrier frequency)**
- at nominal gain, channels E21 to E60: min. 53 dB; typ. 60 dB
- at 20 dB gain reduction, channels E21 to E60: min. 50 dB; typ. 55 dB

**Harmonic content of oscillator sample; only valid for U341LO Mark 2**

**Suppression of harmonics which fall into the frequency range below 1200 MHz (second harmonics of fundamentals below 600 MHz)**
- min. 15 dB (typ 20 dB) below oscillator fundamental

**R.F. rejection at oscillator sample socket; only valid for U341LO Mark 2**

**Signal voltage at oscillator sample socket**
- (input signals of wanted frequency 70 dB (µV) into 75 Ω; tuner operating at nominal gain): min. 20 dB (typ. 24 to 40 dB) below oscillator fundamental

**I.F. rejection (measured at picture carrier and colour sub-carrier frequency)**
- min. 80 dB

**I.F. rejection at oscillator sample socket; only valid for U341LO Mark 2**

**I.F. signals at oscillator sample socket (converted from input signals of wanted frequency 70 dB (µV) into 75 Ω; tuner operating at nominal gain**
- min. 20 dB (typ. 27 up to 35 dB) below oscillator fundamental
1st repeat spot rejection (for i.f. 39.5/33.5 MHz)

Defined as the input level of the picture carrier of channel N + 2, the sound carrier of which produces an i.f. signal (35.0 MHz), which is 52 dB below the picture carrier of the wanted signal N (picture to sound ratio 7 dB; wanted signal 60 dB (µV), tuner operating at nominal gain.

interfering signal \[ \text{typ. } 80 \text{ dB (µV)} \]

\[ \begin{align*}

U.H.F. television tuners

ADDITIONAL INFORMATION

I.F. injection

The tuner has an i.f. injection point at the collector of the i.f. transistor (coupled via a small capacitor to terminal 7). The i.f. generator can be connected directly to this point (Fig.7).

The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig.9.

![Fig.7](image)

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (10) to earth, preferably via a choke of approx. 5 \( \mu \)H outside the tuner (Fig.8). Where the tuner is used in combination with a v.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can inhibit the i.f. output circuit of the switched-off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the receiver i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig.8 should be used.

![Fig.8](image)

*Eventually the two separate damping resistors may be replaced by a common one.

Fig.8
Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig.9.

![](image)

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36.5 MHz; the bandwidth should be approx. 5 MHz (Fig. 10). Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector.

![](image)
Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a plastic tool, which has a cross head according to Fig. 11.
A suitable tool for automatic alignment is available under catalogue number 8104 004 11040.

APPLICATION

These tuners are designed to cover the u.h.f. channels E21 to E69 of C.C.I.R. systems G, H, I and K.

In combination with a suitable v.h.f. tuner, e.g. V317 or V334, they can be used in v.h.f./u.h.f. receivers. The aerial inputs and i.f. outputs of both tuners can then be connected in parallel.

The U342LO is a special version of the U342; an output voltage from the local oscillator is made available for driving digital tuning systems. Apart from this the tuners are identical.
DESCRIPTION

The tuners are u.h.f. tuners with electronic tuning, covering the u.h.f. band from 470 to 860 MHz.

Mechanically, the tuners are built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame, and front and rear covers (see Fig. 2a). All connections (aerial, supply voltages, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Fig. 3. Tuner U342LO has a coaxial socket on the top of the frame for coupling out the oscillator sample.

Electrically, the tuners consist of an input circuit with a high-pass characteristic and a MOS-FET tetrode BF980. This tetrode operates at a drain current of about 10 mA, featuring good noise figures and good signal handling properties. It also acts as an a.g.c. device, controlled by an a.g.c. voltage fed to gate 2. This combination has good signal handling properties throughout the a.g.c. range. The drain load of the MOS-FET tetrode is formed by a double tuned circuit, transferring the signal to the mixer diode 1SS99. The selectivity of this circuit at the image frequency has been improved by special means. The mixer diode is driven by an oscillator, equipped with a transistor BF480. At the U342LO the oscillator sample is coupled out of the mixer via a small capacitor in series with a resistor.

The i.f. signal, originated in the mixer, is amplified by a transistor BF324 in grounded-base configuration. The combination of the Schottky-barrier diode 1SS99 and the i.f. transistor BF324 also features good noise figures and good signal handling properties. Three capacitance diodes BB405B tune the double tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the i.f. transistor BF324 has to be provided outside the tuner, preferably by a choke of about 5 µH. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the i.f. transistor, connected to terminal 7.
Fig. 1.

Fig. 2b I.F. output coil.
Torque for alignment: 2 to 15 mNm
Press-through force: ≥ 10 N

Mass approx. 75 g
Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted into a socket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68 2, test T9 (230 ± 10 °C, 2 ± 0.5 s). The resistance to soldering heat is according to IEC 68 2, test Th (260 ± 5 °C, 10 ± 1 s).

For connection to the socket on the top of tuner U342LO a coaxial plug has to be used; type 3/2.50 (manufacturer: Daut und Rietz) is recommended.
ELECTRICAL DATA

The electrical values are measured on the u.h.f. tuner alone, but they are also valid for the u.h.f. tuner in combination with a v.h.f. tuner V317 or V334. Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0,3 V and an a.g.c. voltage of 9,2 ± 0,2 V.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

- mixer diode: 1SS99
- oscillator: BF480
- tuning diodes: 3 x BB405B
- i.f. amplifier: BF324
- surge protection diodes: 2 x BAV10

Ambient temperature range
- operating: +5 to +55 °C
- storage: −25 to +85 °C

Relative humidity
max. 90%

Voltages and currents

Supply voltage
+12 V ± 10%

Note: The supply voltage at terminal 2 (input stage) should be filtered to avoid hum modulation.

Current drawn from +12 V supply
- r.f. amplifier, at nominal gain: typ. 21 mA
- r.f. amplifier, at 30 dB gain reduction: typ. 10 mA
- oscillator/i.f. amplifier: max. 16 mA

A.G.C. voltage (Fig. 4), at nominal gain: +9,2 ±0,5 V
A.G.C. voltage, at 30 dB gain reduction: min. +1 V

Note: A.G.C. voltages between 0 and +10 V may be applied without risk of damage.

A.G.C. current (Fig. 4)
- during gain control (0 to 30 dB): max. +1 mA
- at nominal gain: typ. +0,9 mA
- at 30 dB gain reduction: typ. +0,1 mA
Tuning voltage range (Fig. 5)
+1 to +28 V

Current drawn from +28 V tuning voltage supply
- at 25 °C
  max. 0,15 µA
  min. 4 MHz/V
- at 55 °C
  max. 0,6 µA

Slope of tuning characteristic
Note: The source impedance of the tuning voltage offered to terminal 4 must be maximum 47 kΩ at tuning voltages below 3 V.

Oscillator sample signal; only valid for U342LO
- at +12 V supply voltage and
  T_{amb} = +25 °C
  typ. 90 dB (µV) into 75 Ω
  min. 80 dB (µV) into 75 Ω
  max. 100 dB (µV) into 75 Ω
  within the given tolerance range of supply voltage and given operating temperature range,
  and within the tuning voltage range +0,5 to +30 V
Note: A tuning voltage higher than +28 V will not be harmful for the tuner and may be applied at the user's own risk. Under this condition the published reverse voltage limit of the oscillator tuning diode will be exceeded; the oscillator frequency will never decrease with increasing tuning voltage.
Frequencies

Frequency range

channel E21 (picture carrier 471,25 MHz)
to channel E69 (picture carrier 855,25 MHz).
Margin at the extreme channels: min. 3 MHz.

Overloading
- Input signal producing 1 dB gain compression at nominal gain
- Input signal producing either a detuning of the oscillator of +300 kHz or −1000 kHz or stopping of the oscillations at nominal gain

Unwanted signal characteristics
- Image rejection (measured at picture carrier frequency)
- Harmonic content of oscillator sample; only valid for U342LO
- Suppression of harmonics which fall into the frequency range below 1200 MHz (second harmonics of fundamentals below 600 MHz)
- R.F. rejection at oscillator sample socket; only valid for U342LO
- Signal voltage at oscillator sample socket (input signals of wanted frequency 70 dB (µV) into 75 Ω; tuner operating at nominal gain)
- I.F. rejection (measured at picture carrier and colour sub-carrier frequency)
- I.F. rejection at oscillator sample socket; only valid for U342LO
- I.F. signals at oscillator sample socket (converted from input signals of wanted frequency 70 dB (µV) into 75 Ω; tuner operating at nominal gain)
N ± 4 rejection
Interference signal for an interference ratio of 53 dB referred to wanted picture carrier (picture to sound carrier ratio of 10 dB; wanted signal 60 dB(µV); tuner operating at nominal gain) typ. 80 dB (µV) into 75 Ω

Cross modulation
Input signal producing 1% cross modulation, i.e. 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)
- at nominal gain (wanted input level 60 dB (µV)) typ. 80 dB (µV) into 75 Ω
- at 26 dB gain reduction (wanted input level 86 dB (µV)) typ. 100 dB (µV) into 75 Ω

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 5)
- at nominal gain (wanted input level 60 dB (µV)) typ. 92 dB (µV) into 75 Ω
- at 26 dB gain reduction (wanted input level 86 dB (µV)) typ. 100 dB (µV) into 75 Ω

Out of band cross modulation, at nominal gain
- v.h.f. I min. 108 dB (µV) into 75 Ω
- v.h.f. III min. 108 dB (µV) into 75 Ω

Oscillator characteristics

Pulling
Input signal of tuned frequency producing a shift of the oscillator frequency of 10 kHz, at nominal gain typ. 80 dB (µV) into 75 Ω

Shift of oscillator frequency
- at a change of the supply voltage of 5% max. 550 kHz
Drift of oscillator frequency

during warm-up time (after the tuner has been completely out of operation for 15 min, measured between 5 s and 15 min after switching on) max. 250 kHz

during warm-up time (after the input stage is in operation for 15 min, measured between 2 s and 15 min after switching on the oscillator/i.f. stage) max. 250 kHz

at a change of the ambient temperature from +25 to +40 °C (measured after 3 cycles from +25 to +55 °C)

channels E21 to E60 max. 500 kHz
channels E61 to E65 max. 650 kHz
channels E66 to E69 max. 750 kHz

I.F. characteristics

Bandwidth of i.f. output circuit 5 +1 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 6; tuning voltage 15 V.

Bandwidth variation of i.f. output circuit as a result of r.f. tuning max. 500 kHz

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 6, i.e. a 100 pF capacitor is connected in parallel with C1; tuning voltage 15 V.

Detuning of the i.f. output circuit as a result of r.f. tuning max. 500 kHz

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 6, i.e. a 100 pF capacitor is connected in parallel with C1; tuning voltage 15 V.
Minimum tuning range of i.f. output coil 33 to 40 MHz
Note: I.F. output of the tuner terminated with the circuit shown in Fig. 6; tuning voltage 15 V.

Attenuation between i.f. injection point and i.f. output of the tuner typ. 23 ± 3 dB

Miscellaneous
Radio interference
Oscillator radiation and oscillator voltage at the aerial terminal Within the limits of C.I.S.P.R. 13 (1975) and VDE 0872/7.72*

Microphonics
There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection
Protection against voltages max. 5 kV
Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes max. 30 kV, 400 mWs
Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

* For U342LO: when the oscillator sample socket is either open or terminated with a coaxial plug (75 Ω impedance, e.g. type 3/2-50, Daut und Rietz).
ADDITIONAL INFORMATION

I.F. injection
The tuner is provided with an i.f. injection point at the collector of the i.f. transistor (coupled via a small capacitor to terminal 7). The i.f. generator can be connected directly to this point (Fig. 7).
The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 6.

![I.F. GENERATOR (Z=75Ω) and i.f. injection point](722749.1)

**Fig. 7.**

Connection of the i.f. amplifier
The tuner needs a d.c. path from the i.f. output terminal (10) to earth, preferably via a choke of approx. 5 µH outside the tuner (Fig. 8). Where the tuner is used in combination with a v.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched-off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 8 should be used.

![i.f. output of v.h.f. tuner, damping resistor, i.f. output of u.h.f. tuner, matching capacitor, choke, and i.f. filter](722750)

**Fig. 8.**
Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 6.

![Diagram of frequency response](image)

**Fig. 9.**

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36.15 MHz; the bandwidth should be approx. 5 MHz (Fig. 9).

Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 10. A suitable tool is available under catalogue number 7122 005 47680.

![Diagram of tool](image)

**Fig. 10.**

APPLICATION

Tuners U343 and U344 are further developments of tuner U341 Mark 2. The U343 is identical to the U344 but without frequency divider, necessary to drive digital tuning systems.

They are meant for use in u.h.f. single standard receivers and have been designed to drive an i.f. surface acoustic wave (SAW) filter. For this purpose the tuners have been provided with a doubled tuned i.f. filter with post-amplifier to compensate for the losses of the SAW filter.

The pinning arrangements of the tuners are compatible with tuner U341 Mark 2 for pins 2, 3, 4, 6 and 10 but differ for pins 7, 8 and 9.

Tuners U343/IEC and U344/IEC are identical to tuners U343 and U344 respectively, but with an IEC aerial socket which meets the IEC 169-2 requirements. It is recommended that plugs which comply with this standard are used.
DESCRIPTION

The tuners are u.h.f. tuners with electronic tuning covering the u.h.f. band from 470 to 860 MHz (channels E21 to E69).

Mechanically the tuners are built on a printed-wiring board and enclosed in a metal housing, comprising a rectangular frame and front and rear covers (see Fig.2). The aerial connection (phono or IEC) is on one of the frame sides, the supply voltage and i.f. connections are on the bottom side and the i.f. injection point on the top side.

Electrically the tuners consist of an input circuit with a high-pass characteristic and a MOS-FET tetrode BF980. The tetrode acts as an r.f. amplifier and as an a.g.c. device controlled by an a.g.c. voltage, fed to gate 2. The drain of the MOS-FET is connected to a double tuned circuit which transfers the signal to the mixer Schottky diode 1SS99. The r.f. selectivity of this circuit at the image frequency has been improved by special means. The mixer diode is driven by an oscillator transistor BF970. The i.f. signal from the mixer is amplified by a transistor BF324, followed by a double-tuned i.f. band-pass filter and a BF370 post-amplifier.

The combination of the Schottky-barrier diode 1SS99 and the i.f. post-amplifier ensures good noise figures and signal handling properties.

Three capacitance diodes OF643 tune the r.f. band-pass filter and oscillator circuit.

*only for U344/256 and U344/256/IEC

Mass approx. 75g
Mounting

The tuner may be mounted by soldering it on to a printed-wiring board with connections as shown by the piercing diagram in Fig.3.

It is recommended that the tuner be installed in a cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta (230 ± 10°C, 2 ± 0.5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5°C, 10 ± 1 s).

*only for U344/256 and U344/256/IEC

Fig.3 Piercing diagram viewed from solder side of board.

In cold chasses where no mains isolation is required the tuner is situated such that the IEC serial socket projects beyond the back plate of the cabinet. Direct access from the aerial cable to the tuner input is then possible. In that case it is advised to provide the tuner with a stress relief around the aerial socket fixed to the set frame.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0.3 V, an a.g.c. voltage of 9.2 ± 0.2 V, and a divider supply voltage of 5 ± 0.2 V.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

General

Semiconductors
- r.f. amplifier: BF980
- mixer diode: 1SS99
- oscillator: BF970
- tuning diodes: 3 x OF643
- i.f. pre-amplifier: BF324
- i.f. post-amplifier: BF370
- frequency divider: SP4653
- surge protection diode: BAV10
- surge protection diode: OF719

Ambient temperature range
- operating: −10 to +60 °C
- storage: −25 to +85 °C

Relative humidity
- max. 90%

Voltages and currents

Supply voltage: +12 V ± 10% (+10%, −15%)

Note: Supply voltages of +12 V −15% are admissible if a deterioration of gain, noise figure, signal handling, oscillator shift and drift is accepted. In this case the min. a.g.c. voltage has to be decreased to 0.8 V to cover the specified a.g.c. range.

Ripple susceptibility

Defined as the peak-to-peak value of a sine wave signal (20 Hz — 500 kHz) on the supply voltages causing an amplitude modulation with a modulation depth of 0.28% on the picture carrier after passing the Nyquist curve of the i.f. filter of a tv receiver.

ripple susceptibility: min. 3 mV peak-to-peak

Current drawn from +12 V supply
- r.f. amplifier, at nominal gain: max. 21 mA
- r.f. amplifier, at 30 dB gain reduction: typ. 11 mA
- oscillator/i.f. amplifier: max. 36 mA

A.G.C. voltage (Fig.4)
- voltage at nominal gain: +9.2 ± 0.5 V
- voltage at 30 dB gain reduction: min. +1 V

Note: A.G.C. voltages between 0 and +10.5 V may be applied without risk of damage.

A.G.C. current (Fig.4)
- during gain control (0 to 30 dB): max. +15 μA
- at nominal gain: typ. +11 μA

Unwanted signal characteristics

Image rejection (measured at picture carrier frequency)
  at nominal gain, channels E21 to E60                min.  53 dB; typ. 60 dB
  at 20 dB gain reduction, channels E21 to E60      min.  50 dB; typ. 55 dB

I.F. rejection (measured at picture carrier and colour sub-carrier frequency)  min.  80 dB

1st repeat spot rejection (for i.f. 39.5/33.5 MHz)
Defined as the input level of the picture carrier of channel N + 2, the sound carrier of which produces an i.f. signal (35.0 MHz), which is 52 dB below the picture carrier of the wanted signal N (picture to sound ratio 7 dB; wanted signal 60 dB (µV), tuner operating at nominal gain.
  interfering signal                                   typ. 80 dB (µV) into 75 Ω

N ± 4 rejection
Interference signal for an interference ratio of
53 dB referred to wanted picture carrier (picture to sound carrier ratio of 7 dB; wanted signal 60 dB (µV); tuner operating at nominal gain)
  N + 4 rejection                                      typ. 80 dB (µV) into 75 Ω
  N - 4 rejection                                      typ.  78 dB (µV) into 75 Ω

Cross modulation
Input signal producing 1% cross modulation, i.e. 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)
  at nominal gain (wanted input level 60 dB (µV))     typ.  80 dB (µV) into 75 Ω
  at 26 dB gain reduction (wanted input level 86 dB (µV)) typ.  94 dB (µV) into 75 Ω

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 5).
  at nominal gain (wanted input level 60 dB (µV))     typ.  92 dB (µV) into 75 Ω
  at 26 dB gain reduction (wanted input level 86 dB (µV)) typ.  95 dB (µV) into 75 Ω

Out of band modulation, at nominal gain
  v.h.f. I                                             min. 108 dB (µV) into 75 Ω
  v.h.f. III                                           min. 108 dB (µV) into 75 Ω

Unwanted signal handling capability
The tuner operates together with a standard tv receiver with normal A.G.C. for tuner and i.f. amplifier. Unwanted tv signal 3 channels higher or lower than wanted. Unwanted signal level adjusted for just not visible interference.
  Unwanted picture carrier signal                      typ.  96 dB (µV)
Oscillator characteristic

Pulling
Input signal of tuned frequency producing a shift of the oscillator frequency of 10 kHz, at nominal gain
typ. 85 dB (µV) into a 75 Ω

Shift of oscillator frequency (ΔF)
at a change of the supply voltage of 5%
max. 500 kHz

Drift of oscillator frequency
during warm-up time (after the tuner has been completely out of operation for 15 min, measured between 5 s and 15 min after switching on)
max. 250 kHz

at a change of the ambient temperature from +25 to +50 °C and +25 °C to 0 °C (measured after 3 cycles from +25 to +55 °C)
max. 1000 kHz

channels E21 to E69

at a change of humidity from 60% ± 15% to 93% ± 2% measured at Tamb 25 °C ± 5 °C,
max. 1500 kHz

Signal to interference ratio at an aerial input level of 100 µV
min. 46 dB

Miscellaneous

Radio interference
Oscillator radiation and oscillator voltage at the aerial terminal
Within the limits of C.I.S.P.R. 13 (1975). Use is made of the relaxed limit of 3 mV/m (70 dB (µVm)).
U.H.F. television tuners

Immunity from radiated interference
Aerial terminal meets requirements of BS905, provided the aerial cable is connected in a professional manner.

Microphonics
There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection
Protection against voltages
max. 5 kV
Note: Ten discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes
min. 30 kV, 400 mWs
Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

E.S.D. protection
min. 2 kV
Note: acc. to MIL STD 003C

January 1987
ADDITIONAL INFORMATION

I.F. injection
The tuner has an i.f. injection point at the collector of BF324 i.f. transistor located at the top side of the tuner. The i.f. generator can be connected directly to this point (Fig.6), via a 0.3 pF capacitor. The tuner needs normal supply voltages and a tuning voltage of 15 V. A probe according to Fig.6 is available under code 7622 468 17940.

Voltage gain
Since the r.f. input and the i.f. output load impedances differ, the gain of the U343 U344 tuners are expressed in terms of voltage gain. It is defined as the ratio between the i.f. output and the corresponding r.f. input voltage.

The i.f. output of the tuner is loaded with an impedance of 1200 Ω in parallel with a 15 pF capacitor representing a standard replacement of the input impedance of a SAW filter.

To be able to carry out tuner measurements with existing 75 Ω equipment a matching circuit is connected to the i.f. output of the tuner. The input gives the required load to the tuner output while the output represents a source impedance suitable to connect to standard 75 Ω equipment, see Fig.7. Total losses of the circuit are 26 dB.

APPLICATION

Designed to cover the u.h.f. channels of C.C.I.R. systems I, G, H and K in u.h.f. single standard receivers. They meet the special requirements of the United Kingdom. The tuners of the U412 series are equipped with a frequency divider, which makes them suitable for digital tuning systems based on frequency synthesis; for the remainder they are equal to type U411.

DESCRIPTION

The U411 and U412 are u.h.f. tuners with electronic tuning. They meet the special requirements of the United Kingdom and are pin-compatible with the UV411, UV417 and the UV412 and UV418 respectively. Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2a). The coaxial aerial connector (phono or IEC) of 75 Ω is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning voltage, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically (see Fig. 1), the tuners consist of a bandpass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The selectivity of this circuit at the image frequency is such that it meets the stringent requirements of the U.K.

The i.f. signal from the mixer is amplified by an i.f. transistor connected in grounded-base configuration. The combination of Schottky barrier diode and i.f. transistor ensures good noise figures and good signal handling properties.

The double tuned circuit and the oscillator circuit are tuned by 3 BB405B capacitance diodes. The i.f. output circuit of the tuner is a single tuned circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver. An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the i.f. amplifier transistor. The tuner is gain controlled via gate 2 of the input MOSFET tetrode.

The electrical circuit of the U412 series is extended with a frequency divider (division ratio of 64 or 256) the inputs of which are connected to the oscillator. The outputs are balanced; they are connected to terminals 12 and 13.

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation. However it is recommended that it is placed in the cool part of the cabinet and away from loudspeaker vibrations.

The solderability of the terminals and mounting tabs (except cut edges) is according to IEC 68-2, test Ta (230 ± 10 °C, 2 ± 0,5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

Fig. 7.

Attenuation between i.f. injection point and i.f. output of the tuner \[ \text{typ. 18 dB} \]

Miscellaneous

Radio interference:

- Oscillator radiation and oscillator voltage at the aerial terminal
- Immunity from radiated interference

Oscillator radiation and oscillator voltage within the limits of C.I.S.P.R. 13 (1975)

- Immunity from radiated interference

Immunity from radiated interference meets the limits of BS905 (1969) with a reserve of at least 5 dB

- Microphonics

Microphonics: there will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection:

- Protection against voltages \[ \text{max. 5 kV} \]
- Protection against flashes \[ \text{max. 30 kV, 400 mWs} \]

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

I.F. injection

Terminal 4 (supply voltage) can be used as i.f. injection point, provided the supply voltage is applied to terminal 4 via a resistor of 10 \( \Omega \) (see Fig. 8). The tuning voltage should be 15 V.
Connection of the i.f. amplifier

Connection to the i.f. amplifier should be either by a printed connection of minimum length or by a shielded connection such as a coaxial cable.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 6.

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36.5 MHz; the bandwidth is approx. 5 MHz (Fig. 9). Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 10. A suitable tool is available under catalogue number 7122 005 47680.

APPLICATION

Tuners U743 and U744 are intended for use in u.h.f. single standard receivers and to drive an i.f. surface acoustic wave (SAW) filter. For this, the tuners have a post-amplifier to compensate for the losses of the SAW filter.

The U743 is identical to the U744 but without frequency divider, necessary to drive digital tuning systems.

The pinning arrangements of the tuners are compatible with the tuners UV615, UV616, UV617, UV618, and the tuner part of the FE617Q(M) and FE618Q(M)/256, see page 9.

DESCRIPTION

The tuners are u.h.f. tuners with electronic tuning covering the u.h.f. band from 470 to 860 MHz (channels E21 to E69).

Mechanically the tuners are built on a printed-wiring board and enclosed in a metal housing, comprising a rectangular frame and front and rear covers (see Fig. 2). The aerial connection (phono or IEC) is on one of the frame sides, the supply voltage and i.f. connections are on the bottom side and the i.f. injection point is accessible through a hole in the cover as shown in Fig. 2.

Electrically the tuners consist of an input circuit with a high-pass characteristic and a MOS-FET tetrode BF990. The tetrode acts as an r.f. amplifier and as an a.g.c. device controlled by an a.g.c. voltage, fed to gate 2. The drain of the MOS-FET is connected to a double tuned circuit which transfers the signal to the mixer transistor 2SC3545. The r.f. selectivity of this circuit at the image frequency has been improved by special means. The mixer transistor is driven by an oscillator transistor BF569. The i.f. signal from the mixer is connected to a tuned i.f. filter and amplified by a BF370 post-amplifier, suitable to drive a surface acoustic wave filter (asymmetric), and to compensate for the SAW losses.

The combination of the r.f. MOS-FET, the 2 GHz mixer transistor and the i.f. post-amplifier ensures good noise figures and signal handling properties.

Three capacitance diodes BB405 tune the r.f. band-pass filter and oscillator circuit.

The electrical circuit of type U744 is extended with a frequency divider (division ratio of 256), the input of which is connected to the oscillator. The symmetrical outputs are connected to terminals 13 and 14.
Fig. 1 For connections see also next page. T.P. = test point (i.f. injection).

Mounting
The tuner may be mounted by soldering it on to a printed-wiring board (using the piercing diagram shown in Fig. 3) without clearance between tuner supports and board. It may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta (230 ± 10 °C, 2 ± 0,5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

(1) Only for U744

1 eb = 0,025 inch

Fig. 3 Piercing diagram viewed from solder side of board. Unless otherwise stated the tolerance is ± 0,05 mm.

In order to prevent any stress to the printed-wiring board, the tuner should be supported at its aerial connector.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0,3 V, an a.g.c. voltage of 9,2 ± 0,2 V, and a divider supply voltage of 5 ± 0,2 V.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

during warm-up time (after the tuner has been completely out of operation for 15 min, measured between 5 s and 15 min after switching on) max. 250 kHz

at a change of the ambient temperature from +25 to +50 °C and +25 °C to 0 °C (measured after 3 cycles from +25 to +55 °C) max. 1000 kHz

channels E21 to E69

at a change of humidity from 60% ± 15% to 93% ± 2% measured at T_{amb} = 25 °C ± 5 °C max. 1500 kHz

I.F. characteristics

Bandwidth of i.f. output circuit typ. 9 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 7, tuning voltage 10 V.

I.F. output impedance approx. 100 Ω

Frequency divider characteristics

Values valid in the tuning voltage range 0,5 to 30 V

Supply voltage 5 V ± 10%

Supply current max. 35 mA, typ. 25 mA

Output voltages (probe 10 MΩ/11 pF)
at pin 7 min. 0,5 V peak-to-peak
at pin 8 min. 0,5 V peak-to-peak

Output unbalance max. 0,1 V

Signal to interference ratio at an aerial input level of 100 µV, measured at i.f. output min. 46 dB

Miscellaneous

Radio interference
Oscillator radiation and oscillator voltage at the aerial terminal

Use is made of the relaxed limit of 3 mV/m (70 dB (µVm)).
U.H.F. television tuners

Immunity from radiated interference

Microphonics

Surge protection
Protection against voltages
Note: Ten discharges of a 470 pF capacitor into the aerial terminal.

E.S.D. protection
Note: acc. to MIL STD 003C

Aerial terminal meets requirements of BS905, provided the aerial cable is connected in a professional manner.

There will be no microphonics, provided the tuner is installed in a professional manner.

Protection against voltages max. 5 kV

Note: acc. to MIL STD 003C
ADDITIONAL INFORMATION

I.F. injection

The tuner has an i.f. injection point at the collector of the mixer transistor (see Figs 1 and 2). The i.f. generator can be connected directly to this point (Fig. 6), via a 0.3 pF capacitor. The tuner needs normal supply voltages and a tuning voltage of 10 V.

Voltage gain

Since the r.f. input and the i.f. output load impedances differ, the gain of the U743 U744 tuners are expressed in terms of voltage gain. It is defined as the ratio between the i.f. output voltage and the corresponding r.f. input voltage.

The i.f. output of the tuner is loaded with an impedance of 1200 Ω in parallel with a 15 pF capacitor representing a standard replacement of the input impedance of a SAW filter.

To be able to carry out tuner measurements with existing 75 Ω equipment a matching circuit is connected to the i.f. output of the tuner. The input gives the required load to the tuner output while the output represents a source impedance suitable to connect to standard 75 Ω equipment, see Fig. 7. Total losses of the circuit are 26 dB.

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems L and L', with extended v.h.f. range including channels for French cable television (CCETT 12 MHz frequency plan).

The tuner USF10A is equipped with a frequency divider (1 : 256), which makes it suitable for digital tuning systems based on frequency synthesis; otherwise this tuner is equal to type USF10.
DESCRIPTION

The USF10 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching covering the low v.h.f. band including the European channel E4 (frequency range 48 to 68 MHz), the high v.h.f. band including the Moroccan channel M4 and the European channel E12 (frequency range 128 to 306 MHz) and the u.h.f. band (frequency range 470 to 861 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 1). The common aerial connection (v.h.f. and u.h.f.) with standard coaxial termination is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 2.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via switchable v.h.f. band wideband input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge).

The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the output circuit of the tuner together with the i.f. amplifier of the television receiver.

The input tuned circuit, the r.f. bandpass filter and oscillator circuit are tuned by 8 tuning diodes, band switching is achieved by 9 switching diodes.

The u.h.f. part of the tuner consists of a tuned input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The input tuned circuit, the r.f. bandpass filter and oscillator circuits are tuned by 4 tuning diodes.

In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrodes.

USF10A

Dimensions in mm

Fig. 1a.

Fig. 1b I.F. output coil.
Torque for alignment: 2 to 15 mN
Press-through force: ≥ 10 N.
Mass  approx. 130 g

Mounting
The tuner may be mounted by soldering it onto a printed-wiring board, using the piercing diagram shown in Fig. 2. (The tuner may also be mounted by means of a socket. Information will be supplied upon request.) The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

Dimensions in mm

(1) Only for USF10A.

Fig. 2 Piercing diagram for tuner USF10A viewed from solder side of board. Unless otherwise stated the tolerance is ± 0.05 mm.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5°C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0,3 V and an a.g.c. voltage of 8,25 ± 0,2 V.

Voltages and currents

Supply voltage + 12 V ± 1 V

Current drawn from +12 V supply

- low v.h.f. band: max. 45 mA; typ. 40 mA
- high v.h.f. band: max. 80 mA; typ. 76 mA
- u.h.f. bands: max. 50 mA; typ. 45 mA

Bandswitching

For operation in all bands the supply voltage is permanently connected to terminal 6. Additionally the supply voltage is connected to:

- terminal 2 and -12 V to terminal 3 for operation in the low v.h.f. band
- terminal 3 and -12 V to terminal 2 for operation in the high v.h.f. band
- terminal 4 and -12 V to terminals 2 and 3 for operation in the u.h.f. bands.

A.G.C. voltage (Figs 3, 4 and 5)

- voltage range: + 8,25 to + 0,85 V
- voltage at nominal gain: + 8,25 ± 0,5 V
- voltage at 40 dB gain reduction: typ. 2 V
- high v.h.f. band: typ. 1,2 V

Note: A.G.C. voltages between 0 and +10,5 V may be applied without risk or damage.

A.G.C. current max. 0,3 µA

Tuning voltage range + 0,5 to + 28 V

Current drawn from 28 V tuning voltage supply

- at Tamb = 25 °C: max. 0,8 µA
- at Tamb = 55 °C: max. 3 µA

Slope of tuning characteristics (typical values)

- low v.h.f. band, channel 2: 2 MHz/V
- channel 4: 1,5 MHz/V
- high v.h.f. band, channel C: 12 MHz/V
- channel Q: 2 MHz/V
- u.h.f. bands, channel L21: 30 MHz/V
- channel L69: 6 MHz/V

Frequencies

Frequency ranges

- low v.h.f. band
  channel E2 (picture carrier 48,25 MHz)

- u.h.f. bands
  - max. 66 dB (µV) into 75 Ω
ADDITIONAL INFORMATION

I.F. injection

Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of 56 Ω (see Fig. 6). The u.h.f. band should be switched on; a tuning voltage of \(-12\) V is applied to terminal 7.

Connection of the i.f. amplifier

No special precautions are required to load and to match the i.f. output of the tuner.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the circuit given in Fig. 7.

This circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit (Fig. 8).

Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and the circuit between a 75 Ω source and a 75 Ω detector.
Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 9. A suitable tool is available under catalogue number 7122 005 47680.

DESCRIPTION

The UV411 and UV412 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the v.h.f. band I including the New Zealand channel 1, and the Italian channel C (frequency range 44 to 92 MHz), the v.h.f. band III including the Morocco channel M4 (frequency range 162 to 230 MHz), and the u.h.f. band (frequency range 470 to 861 MHz).

Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common phono or IEC aerial connector (v.h.f. and u.h.f.) is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuners consist of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via switchable v.h.f. band I/III wide band input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge).

The input filters are provided with an i.f. and f.m. suppression circuit. The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver.

An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the mixer transistor.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes; band switching is achieved by 5 switching diodes.

The u.h.f. part of the tuner consists of a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode.

The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes.

In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrode.

The electrical circuit of the UV412 series is extended with a frequency divider (division ratio of 64 or 256), which inputs are connected to the v.h.f. and u.h.f. oscillator. The complementary outputs are connected to terminals 12 and 13.
* C64 only in versions with IC of Fig. 1b.

December 1986
Mass approx. 127 g

Mounting
The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.) The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta (230 ± 10 °C, 2 ± 0,5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

(1) Only for UV412.

Fig. 3 Piercing diagram viewed from solder side of board. Unless otherwise stated the tolerance is ± 0,05 mm.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0,3 V and an a.g.c. voltage of 9,2 ± 0,2 V.

General

Semiconductors, bands I and III
- r.f. amplifier: BF982, BF324
- mixer
- oscillator
- tuning diodes: 3 x B8809
- switching diodes: 5 x BA482/483/484
- d.c. blocking diodes: 2 x BAW62

Semiconductors, bands IV and V
- r.f. amplifier: BF980 (3SK87)
- oscillator: BF970
- mixer: 1S599
- tuning diodes: 3 x B8405B
- surge protection diodes: 2 x BAV10
- frequency divider: SP4653 or SP4632

Ambient temperature range
- operating: 0 to + 55 °C
- storage: -25 to + 70 °C
- Relative humidity: max. 95%

Voltages and currents

Supply voltage: + 12 V ± 10%

Current drawn from + 12 V supply
- bands I and III: max. 55 mA; typ. 44 mA
- bands IV and V: max. 50 mA; typ. 40 mA

Bandswitching

For operation in all bands the supply voltage is permanently connected to terminal 6. Additionally the supply voltage is connected to:
- terminal 2 for operation in band I,
- terminal 3 for operation in band III,
- terminal 4 for operation in bands IV and V.

A.G.C. voltage (Figs 4, 5 and 6)
- voltage range: + 9,2 to + 0,85 V
- voltage at nominal gain: + 9,2 ± 0,5 V
- voltage at 40 dB gain reduction
  - band I: typ. 3 V
  - band III: typ. 1,5 V
- voltage at 30 dB gain reduction: typ. 2 V

Note: A.G.C. voltages between 0 and + 10,5 V may be applied without risk of damage.

A.G.C. current
- max. 0,3 mA

</table>
I.F. rejection (measured at picture carrier frequency)
- channel NZ1
- channel E2
- channels E3 to C
- band III
- bands IV and V

Note: At colour sub-carrier frequency maximum 6 dB less rejection.

N ± 4 rejection (for u.h.f. only)
Interference signal for an interference ratio of 53 dB referred to wanted picture carrier (picture to sound carrier ratio of 10 dB; wanted signal 60 dB (µV); tuner operating at nominal gain)

Cross modulation
Input signal producing 1% cross modulation, i.e. 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)
- bands I and III
  - at nominal gain (wanted input level 60 dB (µV))
  - at 40 dB gain reduction (wanted input level 100 dB (µV))
- bands IV and V
  - at nominal gain (wanted input level 60 dB (µV))
  - at 30 dB gain reduction (wanted input level 90 dB (µV))

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 2 for v.h.f. I, or channel N ± 3 for v.h.f. III, or channel N ± 5 for u.h.f.)
- bands I and III
  - at nominal gain (wanted input level 60 dB (µV))
  - at 40 dB gain reduction (wanted input level 100 dB (µV))
- bands IV and V
  - at nominal gain (wanted input level 60 dB (µV))
  - at 30 dB gain reduction (wanted input level 90 dB (µV))

Out of band cross modulation at nominal gain
- v.h.f. I, interfering from v.h.f. III
- v.h.f. I, interfering from u.h.f.
- v.h.f. III, interfering from v.h.f. I
- v.h.f. III, interfering from u.h.f.
- u.h.f. interfering from v.h.f. I
- u.h.f. interfering from v.h.f. III
Oscillator characteristics

Pulling
Input signal of tuned frequency producing a shift of the oscillator frequency of 10 kHz,
at nominal gain
bands I and III
typ. 80 dB (µV) into 75 Ω
bands IV and V
typ. 80 dB (µV) into 75 Ω

Shift of oscillator frequency at a change of the supply voltage of 5%
bands I and III max. 200 kHz
bands IV and V max. 400 kHz

Drift of oscillator frequency
during warm-up time (after the tuner has been completely out of operation for 15 min, measured between 5 s and 15 min after switching on)
max. 250 kHz
during warm-up time (after the input stage is in operation for 15 min, measured between 2 s and 15 min after band switching)
max. 250 kHz
at a change of the ambient temperature from + 25 to + 40 °C (measured after 3 cycles from + 25 to + 55 °C)
bands I and III max. 300 kHz
bands IV and V max. 500 kHz

Frequency divider characteristics of version UV412

Supply voltage + 5 V ± 5%

Current drawn from + 5 V supply
bands I and III
max. 45 mA; typ. 35 mA
bands IV and V
max. 55 mA; typ. 45 mA

Output voltage
3.4 to 10 V, depending on load and supply voltage

Output current
at output voltage 3.4 V
min. 1 mA
at output voltage 5 V
max. 1.5 mA

Interference signal on the i.f. output
max. 3 µV

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 10.

The output voltage is determined by the external load and the supply voltage, which is connected to this load. They should be chosen such that:
- the output-voltage rating of 10 V is not exceeded;
- the output voltage does not drop more than 1.6 V below 5 V (supply voltage of frequency divider);
- the output-voltage swing does not exceed 1 V.

Radiation by the output signal may be reduced by transporting the two complementary signals via twisted wires or a flat cable, even if only one signal is to be used to drive the subsequent circuit.

ADDITIONAL INFORMATION

I.F. injection
Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of 10 $\Omega$ (see Fig. 11). The u.h.f. band should be switched on; tuning voltage should be 2 V.

![Fig. 11](7Z86374)

**Connection of the i.f. amplifier**

No special precautions are required to load and to match the i.f. output of the tuner.

**Connection of supply voltages**

![Fig. 12](7Z86375)
Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

![Diagram showing 36.15 MHz and 5 MHz bandwidth with 3 dB loss](image)

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36.15 MHz; the bandwidth is approx. 5 MHz (Fig. 13). Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 47680.

![Diagram of a brass tool with dimensions](image)

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. system D.

A tuner UV412HKM/256/IEC with a frequency divider (1 : 256) is available under catalogue number 3122 237 00240. This version is suitable for digital tuning systems based on frequency synthesis.
DESCRIPTION

The UV411 HKM/IEC is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching, covering the low v.h.f. band (frequency range 48 to 92 MHz), the high v.h.f. band (frequency range 167 to 224 MHz), and the u.h.f. band (frequency range 470 to 870 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common IEC aerial connector (v.h.f. and u.h.f.) is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via switchable wide band input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge).

The input filters are provided with an i.f. and f.m. suppression circuit. The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver. An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the mixer transistor.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes; band switching is achieved by 5 switching diodes.

The u.h.f. part of the tuner consists of a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode.

The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes.

In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrodes.

3122 237 00200
V.H.F./U.H.F. television tuner

Fig. 2b I.F. output coil.
Torque for alignment: 2 to 15 mNm.
Press-through force: $\geq 10$ N.

Mass
approx. 127 g

Mounting
The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.) The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10$ °C, $2 \pm 0.5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5$ °C, $10 \pm 1$ s).

Fig. 3 Piercing diagram viewed from solder side of board. Unless otherwise stated the tolerance is $\pm 0.05$ mm.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0,3 V and an a.g.c. voltage of 9,2 ± 0,2 V.

General

Semiconductors, v.h.f. bands
  r.f. amplifier  BF982
  mixer  BF324
  oscillator  BF926
  tuning diodes  3 x BB809
  switching diodes  5 x BA482/483/484

V.H.F./U.H.F. television tuner

I.F. rejection (measured at picture carrier frequency)
- low v.h.f. band
- channel C1
- channels C2 up to C5
- high v.h.f. band
- u.h.f. bands

min. 45 dB
min. 50 dB
min. 60 dB
min. 60 dB

Note: At colour sub-carrier frequency maximum 6 dB less rejection.

Cross modulation
Input signal producing 1% cross modulation, i.e. 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)
- v.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 40 dB gain reduction (wanted input level 100 dB (µV))
- u.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 30 dB gain reduction (wanted input level 90 dB (µV))

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 2 for low v.h.f., or channel N ± 3 for high v.h.f., or channel N ± 5 for u.h.f.)
- v.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 40 dB gain reduction (wanted input level 100 dB (µV))
- u.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 30 dB gain reduction (wanted input level 90 dB (µV))

Out of band cross modulation at nominal gain
- low v.h.f., interfering from high v.h.f.
- low v.h.f., interfering from u.h.f.
- high v.h.f., interfering from low v.h.f.
- high v.h.f., interfering from u.h.f.
- u.h.f. interfering from low v.h.f.
- u.h.f. interfering from high v.h.f.

Oscillator characteristics

Pulling
Input signal of tuned frequency producing a shift of the oscillator frequency of 10 kHz,
at nominal gain
- v.h.f. bands
- u.h.f. bands
typ. 80 dB (µV) into 75 Ø
typ. 80 dB (µV) into 75 Ø

Shift of oscillator frequency at a change of the supply voltage of 5%
- v.h.f. bands
- u.h.f. bands
max. 200 kHz
max. 400 kHz

Drift of oscillator frequency
during warm-up time (after the tuner has been completely out of operation for 15 min, measured between 5 s and 15 min after switching on)
during warm-up time (after the input stage is in operation for 15 min, measured between 2 s and 15 min after band switching)
at a change of the ambient temperature from +25 to +40 °C (measured after 3 cycles from +25 to +55 °C)
- v.h.f. bands
- u.h.f. bands
max. 250 kHz
max. 250 kHz
max. 300 kHz
max. 500 kHz

I.F. circuit characteristics

Bandwidth of i.f. output circuit
5 ± 1 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 10; tuning voltage 2 V; u.h.f. band switched on.

Bandwidth variation of i.f. output circuit as a result of r.f. tuning and band switching (reference: u.h.f.; tuning voltage 2 V)
max. 650 kHz

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 10, i.e. a 100 pF capacitor is connected in parallel with the i.f. output of the tuner. I.F. output adjusted to 33,75 MHz.
V.H.F./U.H.F. television tuner

Detuning of the i.f. output circuit as a result of r.f. tuning and band switching
(reference: u.h.f.; tuning voltage 2 V) max. 500 kHz

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 10, i.e. a 100 pF capacitor is connected in parallel with the i.f. output of the tuner.

Minimum tuning range of i.f. output coil 30 to 39 MHz
Note: I.F. output of the tuner terminated with the circuit shown in Fig. 10.

Attenuation between i.f. injection point and i.f. output of the tuner typ. 16 dB

Miscellaneous
Radio interference
Oscillator radiation and oscillator voltage at the aerial terminal Within the limits of C.I.S.P.R. 13 (1975) and VDE 0872/7.72.

Microphonics
There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection
Protection against voltages max. 5 kV
Note: 10 discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes max. 30 kV, 400 mWs
Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.
ADDITIONAL INFORMATION

I.F. injection
Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of 10 Ω (see Fig. 11). The u.h.f. band should be switched on; tuning voltage should be 2 V.

![Diagram of I.F. Generator and Television Tuner](image)

Fig. 11.

Connection of the i.f. amplifier
No special precautions are required to load and to match the i.f. output of the tuner.

Connection of supply voltages

![Diagram of Supply Voltages](image)

Fig. 12.
Measuring method of power

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

![Fig. 13.](image)

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 33.75 MHz; the bandwidth is approx. 5 MHz (Fig. 13). Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a plastic tool which has a cross head as shown in Fig. 14. A suitable tool for automatic alignment is available:

- holder catalogue number 7122 005 47910
- cross-head catalogue number 3122 131 63390.

**APPLICATION**

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems B and G, with extended v.h.f. frequency ranges.

The tuner UV418 is equipped with a frequency divider, which makes it suitable for digital tuning systems based on frequency synthesis; otherwise this tuner is equal to type UV417.

Both tuners comply with the requirements of radiation, signal handling capability, and immunity from radiated interference of Amtsblatt DBP69/1981, when installed professionally in an adequate TV receiver.

DESCRIPTION

The UV417 and UV418 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the low v.h.f. band (frequency range 47 to 111 MHz), the high v.h.f. band (frequency range 111 to 300 MHz), and the u.h.f. band (frequency range 470 to 860 MHz).

Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common phono aerial connector (v.h.f. and u.h.f.) is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuners consist of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via switchable wideband low v.h.f. and high v.h.f. input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge).

The input filters are provided with an i.f. suppression circuit. The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor (T.P.1.).

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, where at the low impedance side the i.f. signal is coupled out of the tuner. A test point, which is accessible through a hole in the top of the frame is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver. An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the mixer transistor (T.P.1.).

The input, the r.f. band pass filter and oscillator circuits are tuned by 5 tuning diodes; band switching is achieved by 5 switching diodes.

The u.h.f. part of the tuner consists of a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The input, the r.f. bandpass filter and oscillator circuits are tuned by 4 tuning diodes.

In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrode.

The electrical circuit of the UV418 series is extended with a frequency divider (division ratio of 64 or 256), which inputs are connected to the v.h.f. and u.h.f. oscillator. The complementary outputs are connected to terminals 12 and 13.
Fig. 1. Circuit diagram. For connections see also next page.

only for UV418
V.H.F./U.H.F. television tuners

Mass
approx. 127 g

Mounting
The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request). The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2-20, test Ta (230 ± 10 °C, 2 ± 0.5 s). The resistance to soldering heat is according to IEC 68-2-20, test Tb (260 ± 5 °C, 10 ± 1 s).

(1) Only for UV418.

Fig. 3 Piercing diagram viewed from solder side of board. Unless otherwise stated the tolerance is ± 0.05 mm.

Marking
The tuner is provided with a label showing the following date:
- type number
- catalogue number
- code for factory of origin
- change code
- code for year and week of production
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0,3 V and an a.g.c. voltage of 9,2 ± 0,2 V.

Unwanted signal characteristics

Image rejection (measured at picture carrier frequency)
- v.h.f. bands
- u.h.f. bands, except channels E61 to E69
  - channels E61 to E69

I.F. rejection (measured at picture carrier frequency)
- low v.h.f., except channel E2
- channel E2
- high v.h.f.
- u.h.f.

Note: At colour sub-carrier frequency maximum 6 dB less rejection

Cross modulation
Input signal producing 1% cross modulation, i.e. 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)
- v.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 40 dB gain reduction (wanted input level 100 dB (µV))
- u.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 30 dB gain reduction (wanted input level 90 dB (µV))

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 2 for low v.h.f., or channel N ± 3 for high v.h.f., or channel N ± 5 for u.h.f.)
- v.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 40 dB gain reduction (wanted input level 100 dB (µV))
- u.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 30 dB gain reduction (wanted input level 90 dB (µV))

Out of band cross modulation at nominal gain
- low v.h.f., interfering from high v.h.f.
- low v.h.f., interfering from u.h.f.
- high v.h.f., interfering from low v.h.f.
- high v.h.f., interfering from u.h.f.
- u.h.f. interfering from low v.h.f.
- u.h.f. interfering from high v.h.f.

Unwanted signal handling capability (visibility test)

For the channel combinations
- v.h.f.: N ± 1, N ± 5, N + 11
- u.h.f.: N ± 1, N ± 5, N + 9

The tuner meets the requirements of "Amtsblatt" DBP69/1981, item 5.1.2., when measured in an adequate TV receiver. The a.g.c. circuit of the TV receiver has to be adjusted with an input signal of 74 dB (µV) on channel E60 in such a way, that the gain of the tuner is decreased by 10 dB.

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 4, i.e. a 100 pF capacitor is connected in parallel with the i.f. output of the tuner.

Minimum tuning range of i.f. output coil 33 to 40 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 4.

Attenuation between i.f. injection point and i.f. output of the tuner typ. 16 dB

Miscellaneous

Radio interference
Oscillator radiation and oscillator voltage at the aerial terminal Within the limits of C.I.S.P.R. 13 (1975) and VDE 0872/7.72 and Amtsblatt DBP69/1981, when applying the tuner in an adequate TV receiver.

Microphonics
There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection
Protection against voltages max. 5 kV

Note: 10 discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.
ADDITIONAL INFORMATION

I.F. injection
An i.f. signal from a generator with an internal resistance of 50 Ω or 75 Ω should be connected to the i.f. injection point at the top of the tuner (see Fig. 2) via a resistor of 68 Ω. The u.h.f. band should be switched on; tuning voltage should be 25 V, a.g.c. voltage 1 V.

Measuring method of power gain
The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 4.

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth is approx. 5,5 MHz (Fig. 5). Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector.

Alignment of the i.f. output coil
The i.f. output coil should be adjusted with a plastic tool which has a cross head as shown in Fig. 6. A suitable tool for automatic alignment is available under catalogue number 8104 004 11040.

APPLICATION

This tuner is designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems M and N (R.T.M.A.).

It can be provided with a frequency divider, which makes this tuner suitable for digital tuning systems based on frequency synthesis.
DESCRIPTION

The UV431 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching, covering the low v.h.f. band (frequency range 55.25 to 83.25 MHz), the high v.h.f. band (frequency range 175.25 to 211.25 MHz), and the u.h.f. band (frequency range 471.25 to 885.25 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common phono aerial connector (v.h.f. and u.h.f.) is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuner consists of a v.h.f. and a u.h.f. part. The v.h.f. aerial signal is fed via low pass, high pass, i.f. and f.m. suppression filters to a switchable single tuned input circuit for low and high v.h.f. operation, which is capacitively coupled to the gate 1 of a MOS-FET tetrode (with internal gate protection against surge). The drain load of the MOS-FET tetrode is formed by a double tuned, switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver. An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the mixer transistor.

The single tuned input, the r.f. band pass filter and oscillator circuits are tuned by 4 tuning diodes; band switching is achieved by 5 switching diodes.

The u.h.f. part of the tuner consists of a fixed double tuned band pass filter with a built-in protection diode against surge which is connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes.

In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrodes.

Fig. 2b  I.F. output coil.
Torque for alignment: 2 to 15 mNm.
Press-through force: ≥ 10 N.
Mass  approx. 125 g.

Mounting
The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta (230 ± 10 °C, 2 ± 0,5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

Marking
The tuner is provided with a label showing the following data:
- type number UV 431
- catalogue number 3112 127 43630
- code for factory of origin
- change code
- code for year and week of production
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0,3 V and an a.g.c. voltage of 9,2 ± 0,2 V.

General

Semiconductors, v.h.f. bands
- r.f. amplifier: BF982
- mixer: BF324
- oscillator: BF926
- tuning diodes: 4 x BB809
- switching diodes: 5 x BA482/483/484
- d.c. blocking diodes: 2 x BAW62

Semiconductors, u.h.f. bands
- r.f. amplifier: BF980
- oscillator: BF970
- mixer: 1SS99
- tuning diodes: 3 x BB405B
- surge protection diodes: BAV10

Ambient temperature range
- operating: 0 to + 55 °C
- storage: -25 to + 70 °C

Relative humidity
- max. 95%

Voltages and currents

Supply voltage
- + 12 V ± 10%*

Current drawn from + 12 V supply
- low and high v.h.f.: max. 55 mA; typ. 42 mA
- u.h.f.: max. 50 mA; typ. 42 mA

Bandswitching

For operation in all bands the supply voltage is permanently connected to terminal 6. Additionally the supply voltage is connected to:
- terminal 2 for low v.h.f. operation
- terminal 3 for high v.h.f. operation
- terminal 4 for u.h.f. operation

A.G.C. voltage (Figs 4, 5 and 6)
- voltage range: + 9,2 to + 0,85 V
- voltage at nominal gain: + 9 ± 0,5 V
- voltage at 40 dB gain reduction
  - low v.h.f.: typ. 3,2 V
  - high v.h.f.: typ. 1,5 V
- voltage at 30 dB gain reduction
  - u.h.f.: typ. 1,4 V

Note: A.G.C. voltages between 0 and + 10,5 V may be applied without risk of damage.

A.G.C. current
- max. 0,3 mA

Slope of a.g.c. characteristic,
- at the end of the specified a.g.c. range
  - v.h.f.: typ. 25 dB/V
  - u.h.f.: typ. 50 dB/V

* A tolerance of −15% on the supply voltage is admissible, if a deterioration of gain, noise figure, oscillator shift and oscillator drift is acceptable.

Channel A6 colour beat
The colour beat is an interference at 42 MHz from picture and sound carrier signals of channel A6 with
the oscillator signal (input levels of picture/sound carrier signals 54 dB(µV); tuner operated at nominal
gain.

Rejection below IF picture carrier of 45,75 MHz.     typ. 45 dB

N ± 7 rejection (for u.h.f. only)
Interference signal for an interference
ratio of 53 dB referred to wanted picture
carrier (wanted signal 60 dB (µV); tuner
operating at nominal gain)     typ. 65 dB (µV) into 75 Ω
Cross modulation
Input signal producing 1% cross modulation, i.e. 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)

v.h.f. bands
- at nominal gain (wanted input level 60 dB (µV))
  typ. 76 dB (µV) into 75 Ω
- at 40 dB gain reduction (wanted input level 100 dB (µV))
  typ. 94 dB (µV) into 75 Ω

u.h.f. bands
- at nominal gain (wanted input level 60 dB (µV))
  typ. 74 dB (µV) into 75 Ω
- at 30 dB gain reduction (wanted input level 90 dB (µV))
  typ. 88 dB (µV) into 75 Ω

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 2 for low v.h.f., or channel N ± 3 for high v.h.f., or channel N ± 5 for u.h.f.)

v.h.f. bands
- at nominal gain (wanted input level 60 dB (µV))
  typ. 88 dB (µV) into 75 Ω
- at 40 dB gain reduction (wanted input level 100 dB (µV))
  typ. 100 dB (µV) into 75 Ω

u.h.f. bands
- at nominal gain (wanted input level 60 dB (µV))
  typ. 82 dB (µV) into 75 Ω
- at 30 dB gain reduction (wanted input level 90 dB (µV))
  typ. 88 dB (µV) into 75 Ω

Out of band cross modulation at nominal gain
- low v.h.f., interfering from high v.h.f.
  typ. 100 dB (µV) into 75 Ω
- low v.h.f., interfering from u.h.f.
  typ. 100 dB (µV) into 75 Ω
- high v.h.f., interfering from low v.h.f.
  typ. 100 dB (µV) into 75 Ω
- high v.h.f., interfering from u.h.f.
  typ. 100 dB (µV) into 75 Ω
- u.h.f. interfering from low v.h.f.
  typ. 94 dB (µV) into 75 Ω
- u.h.f. interfering from high v.h.f.
  typ. 86 dB (µV) into 75 Ω

Oscillator characteristics
Pulling:
Input signal of tuned frequency producing a shift of the oscillator frequency of 10 kHz, at nominal gain
- low v.h.f.
  typ. 88 dB (µV) into 75 Ω
- high v.h.f.
  typ. 86 dB (µV) into 75 Ω
- u.h.f.
  typ. 80 dB (µV) into 75 Ω

Shift of oscillator frequency at a charge of the supply voltage of 5%
- v.h.f. bands
  max. 200 kHz
- u.h.f. bands,
  - channels A14 to A73
    max. 400 kHz
  - channels A74 to A83
    max. 800 kHz
Drift of oscillator frequency
during warm-up time (after the tuner has been completely out of operation for 15 min, measured between 5 s and 15 min after switching on)
during warm-up time (after the input stage is in operation for 15 min, measured between 2 s and 15 min after band switching)
at a change of the ambient temperature from +25 to +50 °C (measured after 3 cycles from +25 to +55 °C)
at a change of humidity from 60 ± 15% to 93 ± 2%

Detuning of the i.f. output circuit as a result of r.f. tuning and band switching (reference: u.h.f.; tuning voltage 10 V; i.f. output circuit adjusted to 43,5 MHz)

max. 650 kHz

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 10, i.e. a 100 pF capacitor is connected in parallel with the i.f. output of the tuner.

**Minimum tuning range of i.f. output coil**

41 to 47 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 10. The tuner is supplied with the i.f. output circuit adjusted to 43,5 ± 1 MHz.

**Attenuation between i.f. injection point and i.f. output of the tuner**

typ. 16 dB
Miscellaneous

Radio interference
Oscillator radiation and oscillator voltage at the aerial terminal
Within the limits of C.I.S.P.R. 13 (1975)
There will be no microphonics, provided the tuner is installed in a professional manner.

Microphonics

Surge protection
Protection against voltages max. 5 kV
Note: 10 discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes max. 30 kV, 400 mWs
Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

I.F. injection
Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of 10 Ω (see Fig. 11). The u.h.f. band should be switched on; tuning voltage should be 2 V.

Connection of the i.f. amplifier
— By means of a print track as short as possible.
— By means of a shielded track, e.g. a coaxial cable.

Connection of supply voltages

Fig. 11.

Fig. 12.
Measuring method of power gain
The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit which should be tuned to 43.5 MHz; the bandwidth is approx. 5 MHz (Fig. 13). Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector.

Measurement of bandwidth variation and detuning of i.f. output circuit
A sweep signal of 30 to 50 MHz from a frequency sweep generator is connected to the i.f. injection point via a capacitor of 0.5 pF. The coaxial cable is terminated with 75 Ω.

Alignment of the i.f. output coil
The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 4780.

* In accordance with the publications of the Australian Broadcasting Control Board (A.B.C.B.).
DESCRIPTION

The UV461 and UV462 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the low v.h.f. band including the New Zealand channel 1, and the Italian channel C (frequency range 44 to 92 MHz), the high v.h.f. band including the Morocco channel M4 (frequency range 162 to 230 MHz), and the u.h.f. band (frequency range 470 to 861 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common 75 Ω phono or IEC aerial connector (v.h.f. and u.h.f.) is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via switchable low and high v.h.f. wide band input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The input filters are provided with an i.f. suppression circuit. The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver. An additional test point, which is accessible through a hole in the top of the tuner, is connected to the collector of the mixer transistor.

The r.f. band pass filter and oscillator circuits are tuned by 5 tuning diodes; band switching is achieved by 5 switching diodes. The u.h.f. part of the tuner consists of a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes. In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrodes.

The electrical circuit of the UV462 is extended with a frequency divider (division ratio of 256), which inputs are connected to the v.h.f. and u.h.f. oscillator. The complementary outputs are connected to terminals 12 and 13.

Torque for alignment: 2 to 15 mNm.
Press-through force: ≥10 N.

**Mass**
approx. 127 g

**Mounting**
The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request). The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta (230 ± 10°C, 2 ± 0,5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5°C, 10 ± 1 s).

(1) Only for UV462.

**Fig. 3** Piercing diagram viewed from solder side of board.
Unless otherwise stated the tolerance is ± 0,05 mm.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0,3 V and an a.g.c. voltage of 9,2 ± 0,2 V.

General

Semiconductors, v.h.f. bands
- r.f. amplifier: BF980
- mixer: BF324
- oscillator: BF926
- tuning diodes: 5 x BB909B
- switching diodes: 5 x BA482/483/484
- d.c. blocking diodes: 2 x IN4148

Semiconductors, u.h.f. bands
- r.f. amplifier: BF980
- oscillator: BF970
- mixer: 1SS99
- tuning diodes: 3 x OF643
- surge protection diodes: 1 x BAV10
- frequency divider: SP4653

Ambient temperature range
- operating: 0 to + 55 °C
- storage: -25 to + 70 °C

Relative humidity: max. 95%

Voltages and currents

Supply voltage: + 12 V ± 10%

Current drawn from + 12 V supply
- v.h.f. bands: max. 55 mA; typ. 39 mA
- u.h.f. bands: max. 50 mA; typ. 40 mA

Bandswitching

For operation in all bands the supply voltage is permanently connected to terminal 6. Additionally the supply voltage is connected to:
- terminal 2 for operation in the low v.h.f. band
- terminal 3 for operation in the high v.h.f. band
- terminal 4 for operation in the u.h.f. bands

A.G.C. voltage (Figs 4, 5 and 6)
- voltage range: + 9,2 to + 0,85 V
- voltage at nominal gain: + 9,2 ± 0,5 V
- voltage at 40 dB gain reduction
  - low v.h.f. band: typ. 3 V
  - high v.h.f. band: typ. 2 V
- voltage at 30 dB gain reduction, u.h.f. bands: typ. 1,6 V

Note: A.G.C. voltages between 0 and +10,5 V may be applied without risk of damage.

A.G.C. current: max. 0,3 mA

Slope of a.g.c. characteristic,
at the end of the specified a.g.c. range
- v.h.f. bands: typ. 25 dB/V
- u.h.f. bands: typ. 50 dB/V

typ. 90 dB (μV) into 75 Ω

Input signal producing either a detuning
of the oscillator of + 300 kHz or
−1000 kHz or stopping of the
oscillations at nominal gain
typ. 100 dB (μV) into 75 Ω
typ. 100 dB (μV) into 75 Ω
Unwanted signal characteristics

Image rejection (measured at picture carrier frequency)
- v.h.f. bands
- u.h.f. bands, channels 21 to 27
  - channels 28 to 62
  - channels 63 to 69

I.F. rejection (measured at picture carrier frequency)
- v.h.f. bands
- u.h.f. bands

Note: At colour sub-carrier frequency maximum 6 dB less rejection.

N ± 4 rejection (for u.h.f. only)
Interference signal for an interference ratio of 47 dB referred to wanted picture carrier (picture to sound carrier ratio of 10 dB; wanted signal 60 dB (µV); tuner operating at nominal gain)

Cross modulation
Input signal producing 1% cross modulation, i.e. 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)
- v.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 40 dB gain reduction (wanted input level 60 dB (µV))
- u.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 30 dB gain reduction (wanted input level 90 dB (µV))

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 2 for low v.h.f., or channel N ± 3 for high v.h.f., or channel N ± 5 for u.h.f.)
- v.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 40 dB gain reduction (wanted input level 100 dB (µV))
- u.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV))
  - at 30 dB gain reduction (wanted input level 90 dB (µV))

Out of band cross modulation at nominal gain
- low v.h.f., interfering from high v.h.f.
- low v.h.f., interfering from u.h.f.
- high v.h.f., interfering from low v.h.f.
- high v.h.f., interfering from u.h.f.
- u.h.f., interfering from low v.h.f.
- u.h.f., interfering from high v.h.f.
Oscillator characteristics

Pulling
Input signal of tuned frequency producing a shift of the oscillator frequency of 10 kHz, at nominal gain
- v.h.f. bands
- u.h.f. bands

Shift of oscillator frequency at a change of the supply voltage of 5%
- v.h.f. bands
- u.h.f. bands

Drift of oscillator frequency during warm-up time (after the tuner has been completely out of operation for 15 min, measured between 5 s and 15 min after switching on)
During warm-up time (after the input stage is in operation for 15 min, measured between 2 s and 15 min after band switching)
At a change of the ambient temperature from +25 to +50 °C (measured after 3 cycles from +25 to +55 °C)
- v.h.f. bands
- u.h.f. bands

Frequency divider characteristics (UV462)

Supply voltage
Current drawn from +5 V supply
Output voltage, at terminals 12 and 13 unloaded with 820 Ω load

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 10.

Attenuation between i.f. injection point and i.f. output of the tuner  
typ. 16 dB

Miscellaneous

Radio interference  
Oscillator radiation and oscillator voltage at the aerial terminal  

There will be no microphonics, provided the tuner is installed in a professional manner.

Microphonics

Surge protection  
Protection against voltages  
max. 5 kV

Note: 10 discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes  
max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.
ADDITIONAL INFORMATION

I.F. injection

Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of 10 Ω (see Fig. 11). The u.h.f. band should be switched on; tuning voltage should be 18 V.

Connection of the i.f. amplifier

No special precautions are required to load and to match the i.f. output of the tuner.

Connection of supply voltages
Measuring method of power gain
The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

![Figure 13](image13.png)

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36.15 MHz; the bandwidth is approx. 5 MHz (Fig. 13). Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector.

Alignment of the i.f. output coil
The i.f. output coil should be adjusted with a plastic tool, which has a crosshead as shown in Fig. 14. A suitable tool for automatic alignment is available under catalogue number 8104 004 11040.

DESCRIPTION

The UV471 and UV472 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the television bands used in South Africa in accordance with the publications of the South African Bureau of Standards (S.A.B.S.).

Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common 75 Ω aerial connector (v.h.f. and u.h.f.) is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuners consist of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via a tuned input circuit to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of the MOSFET tetrode is formed by a double tuned filter, transferring the r.f. signal to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver. An additional test point (T.P.), which is accessible through a hole in the top of the tuner, is connected to the collector of the mixer transistor.

The r.f. band pass filter and oscillator circuits are tuned by 4 tuning diodes.

The u.h.f. part of the tuners consist of a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The r.f. band pass filter and oscillator circuits are tuned by 3 tuning diodes.

In all bands the tuners are gain controlled via gate 2 of the input MOSFET tetrode.

The electrical circuit of the UV472 is extended with a frequency divider (division ratio of 256 or 64), which inputs are connected to the v.h.f. and u.h.f. oscillator. The complementary outputs are connected to terminals 12 and 13.

and i.f. output of the tuner
**Miscellaneous**

Radio interference
Oscillator radiation and oscillator voltage at the aerial terminal

**Microphonics**

Within the limits of C.I.S.P.R. 13 (1975) and S.A.B.S. requirements There will be no microphonics, provided the tuner is installed in a professional manner.

**Surge protection**

Protection against voltages
Note: 10 discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes
Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

**ADDITIONAL INFORMATION**

**I.F. injection**

Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of 10 Ω (see Fig. 9). The u.h.f. band should be switched on; tuning voltage should be 25 V.

![Fig. 9.](image)

**Connection of the i.f. amplifier**

No special precautions are required to load and to match the i.f. output of the tuner.

**Connection of supply voltages**

![Fig. 10.](image)
Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 8.

The RC-circuit roughly matches the i.f. output impedance to 75 $\Omega$ at the resonant frequency of the i.f. output circuit, which should be tuned to 36.15 MHz; the bandwidth is approx. 5 MHz (Fig. 11). Because the input and output impedances of the tuner are now 75 $\Omega$, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 $\Omega$ source and a 75 $\Omega$ detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a plastic tool, which has a cross head as shown in Fig. 12. A suitable tool for automatic alignment is available under catalogue number 8104 004 11040.

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems B, G and H with extended v.h.f. frequency ranges, including the hyperband.

The i.f. output is designed for direct drive of a variety of SAW filters.

The tuner UV616/256 is equipped with a frequency divider, which makes it suitable for digital tuning systems based on frequency synthesis; for the remainder it is equal to type UV615.

Both tuners comply with the requirements of radiation, signal handling capability, and immunity from radiated interference of Amtsblatt DBP69/1981, when installed professionally in an adequate TV receiver.
V.H.F./U.H.F. television tuners

UV615
UV616/256

Fig. 1 Circuit diagram.
DESCRIPTION

The UV615 and UV616/256 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the low v.h.f. band (frequency range 46 to 110 MHz), the high v.h.f. band (frequency range 111 to 300 MHz), the hyperband (frequency range 300 to 470 MHz), and the u.h.f. band (frequency range 470 to 860 MHz).

Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a die-cast metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common IEC coaxial aerial connector (75 Ω) is integrated in one of the frame sides of the housing, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuners consist of v.h.f., hyperband and u.h.f. parts (see Fig. 1). They are equipped with a common aerial input and provided with tuned r.f. MOSFET input stages. The v.h.f. mixer, v.h.f. oscillator and i.f. amplifier functions are provided by a tuner IC. This IC has terminals between mixer and i.f. amplifier to connect i.f. preselections, a 40.4 MHz trap is provided to improve the selectivity of common SAW filters for adjacent channel N - 1 (system B).

Output impedance of the symmetrical i.f. terminals is approx. 75 Ω to insure sufficient triple transient suppression of the SAW filter.

The r.f. band pass filter and oscillator circuits of the v.h.f. part are tuned by 7 tuning diodes; band switching is achieved by 4 switching diodes, those of the hyperband by 4 tuning diodes and 1 switching diode respectively.

The u.h.f. part of the tuner has a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the i.f. pre-amplifier of the tuner I.C.

The r.f. band pass filter and oscillator circuits are tuned by 4 tuning diodes.

In all bands the tuner is gain-controlled via gate 2 of the input MOSFET tetrode.

A test point TP1 is provided for i.f. injection.

The electrical circuit of the UV616/256 is extended with a frequency divider (division ratio of 256), with an input connected to the v.h.f., hyperband and u.h.f. oscillators. The symmetrical ECL outputs are connected to terminals 13 and 14.

Overloading

Input signal producing 1 dB gain compression at nominal gain v.h.f. bands and hyperband

\[ \text{typ. 90 dB (µV) into 75 } \Omega \]

Input signal producing either a detuning of the oscillator of +300 kHz or –1000 kHz or stopping of the oscillations at nominal gain v.h.f. bands

\[ \text{typ. 105 dB (µV) into 75 } \Omega; \text{ min. 100 dB (µV)} \]

\[ \text{typ. 100 dB (µV) into 75 } \Omega; \text{ min. 90 dB (µV)} \]

Unwanted signal characteristics

Image rejection (measured at picture carrier frequency)

\[ \text{v.h.f. bands and hyperband} \]

\[ \text{min. 66 dB; typ. 70 dB} \]

\[ \text{min. 66 dB; typ. 70 dB} \]

\[ \text{min. 53 dB; typ. 65 dB} \]

I.F. rejection (measured at picture carrier frequency)

\[ \text{all bands} \]

\[ \text{min. 60 dB} \]

Note: At colour sub-carrier frequency maximum 6 dB less rejection.

Cross modulation

Input signal producing 1% cross modulation, i.e. 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)

\[ \text{v.h.f. bands and hyperband} \]

\[ \text{at nominal gain (wanted input level 60 dB (µV))} \]

\[ \text{typ. 75 dB (µV) into 75 } \Omega \]

\[ \text{at 40 dB gain reduction (wanted input level 100 dB (µV))} \]

\[ \text{typ. 100 dB (µV) into 75 } \Omega \]

\[ \text{u.h.f. bands} \]

\[ \text{at nominal gain (wanted input level 60 dB (µV))} \]

\[ \text{typ. 75 dB (µV) into 75 } \Omega \]

\[ \text{at 30 dB gain reduction (wanted input level 90 dB (µV))} \]

\[ \text{typ. 100 dB (µV) into 75 } \Omega \]

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 2 for low v.h.f., or channel N ± 3 for high v.h.f., or channel N ± 5 for u.h.f. and hyperband)

\[ \text{v.h.f. bands and hyperband} \]

\[ \text{at nominal gain (wanted input level 60 dB (µV))} \]

\[ \text{typ. 95 dB (µV) into 75 } \Omega \]

\[ \text{at 40 dB gain reduction (wanted input level 100 dB (µV))} \]

\[ \text{typ. 100 dB (µV) into 75 } \Omega \]

\[ \text{u.h.f. bands} \]

\[ \text{at nominal gain (wanted input level 60 dB (µV))} \]

\[ \text{typ. 100 dB (µV) into 75 } \Omega \]

\[ \text{at 30 dB gain reduction (wanted input level 90 dB (µV))} \]

\[ \text{typ. 100 dB (µV) into 75 } \Omega \]

Out of band cross modulation at nominal gain each of the v.h.f., u.h.f. or hyperbands interfering with any of the other bands mentioned

\[ \text{typ. 100 dB (µV) into 75 } \Omega \]
### Unwanted signal handling capability (visibility test)

For the channel combinations:
- v.h.f. and hyperband: $N \pm 1, N \pm 5, N + 11$
- u.h.f.: $N \pm 1, N \pm 5, N + 9$

The tuner meets the requirements of "Amtsblatt" DBP/1981, item 5.1.2, when measured in an adequate TV receiver.

### Oscillator characteristics

**Pulling**

Input signal of tuned frequency producing a shift of the oscillator frequency of 10 kHz, at nominal gain:
- **all bands**
  - typ. $86 \, \text{dB (µV)}$ into $75 \, \Omega$

**Shift of oscillator frequency at a change of the supply voltage of ±5%**
- **v.h.f. bands**
  - max. $250 \, \text{kHz}$
- **hyperband**
  - max. $500 \, \text{kHz}$
- **u.h.f. bands**
  - max. $500 \, \text{kHz}$

**Drift of oscillator frequency**

- **during warm-up time** (after the tuner has been completely out of operation for 15 min, measured between 5 s and 15 min after switching on)
  - max. $250 \, \text{kHz}$

- **during warm-up time** (after the input stage is in operation for 15 min, measured between 2 s and 15 min after band switching)
  - max. $250 \, \text{kHz}$

- **at a change of the ambient temperature from +25 to +50 °C** (measured after 3 cycles from +25 to 0 °C)
  - **v.h.f. bands**
    - max. $500 \, \text{kHz}$
  - **hyperband**
    - max. $750 \, \text{kHz}$
  - **u.h.f. bands**
    - max. $1000 \, \text{kHz}$

- **at a change of humidity from 60 ± 15% to 93 ± 2%, at $T_{\text{amb}} = 25 \pm 5 \, \text{°C}$**
  - **low v.h.f. band**
    - max. $500 \, \text{kHz}$
  - **high v.h.f. band**
    - max. $1000 \, \text{kHz}$
  - **hyperband**
    - max. $1300 \, \text{kHz}$
  - **u.h.f. bands**
    - max. $1500 \, \text{kHz}$
Frequency divider characteristics of the UV616/256

- **Division ratio**
- **Supply voltage** +5 V ± 5%
- **Current drawn from +5 V supply** max. 35 mA; typ. 25 mA
- **Output voltage, unloaded, measured with probe 10 MΩ/11 pF** min. 0.5 V p-p
- **Output impedance** typ. 1 kΩ
- **Output imbalance** typ. 0.1 V
- **Interference signal on the i.f. output** max. 30 dB (µV)

**Note:** I.F. output of the tuner terminated with 10 MΩ/11 pF.

**Miscellaneous**

Radio interference
Oscillator radiation and oscillator voltage at the aerial terminal

Within the limits of C.I.S.P.R. 13 (1975), VDE0872/7.72, and Amtsblatt DBP69/1981, when applying the tuner in an adequate TV receiver.

There will be no microphonics, provided the tuner is installed in a professional manner.

Microphonics

Surge protection
Protection against voltages max. 5 kV

Note: 10 discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

**ADDITIONAL INFORMATION**

**I.F. injection**

An i.f. signal from a generator (internal resistance 50 Ω or 75 Ω) should be connected to the i.f. injection point TP1, accessible through a hole in the cover (see Fig. 2) via a probe (see Fig. 5).

## APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems B, G and H with extended v.h.f. frequency ranges.

The tuner UV618/256 is equipped with a frequency divider, which makes it suitable for digital tuning systems based on frequency synthesis; for the remainder it is equal to type UV617.

## Available versions

Both tuners comply with the requirements of radiation, signal handling capability, and immunity from radiated interference of Amtsblatt DBP69/1981, when installed professionally in an adequate TV receiver.
The UV617 and UV618/256 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the low v.h.f. band (frequency range 46 to 110 MHz), the high v.h.f. band (frequency range 111 to 300 MHz), and the u.h.f. band (frequency range 470 to 860 MHz).

Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a die-cast metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common IEC coaxial aerial connector (75 Ω) is integrated in one of the frame sides of the housing, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuners consist of v.h.f. and u.h.f. parts (see Fig. 1). They are equipped with a common aerial input and provided with r.f. MOSFET input stages. The v.h.f. mixer, v.h.f. oscillator and i.f. amplifier functions are provided by a tuner IC. This IC has terminals between mixer and i.f. amplifier to connect i.f. preselections, a 40,4 trap is provided to improve the selectivity of common SAW filters for adjacent channel N - 1 (system B).

Output impedance of the symmetrical i.f. terminals is approx. 75 Ω to insure sufficient triple transient supression of the SAW.

The r.f. band pass filter and oscillator circuits are tuned by 7 tuning diodes; band switching is achieved by 4 switching diodes.

The u.h.f. part of the tuner has a high-pass input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the i.f. pre-amplifier of the tuner I.C.

The r.f. band pass filter and oscillator circuits are tuned by 4 tuning diodes.

In all bands the tuner is gain-controlled via gate 2 of the input MOSFET tetrode.

A test point TP1 is provided for i.f. injection.

The electrical circuit of the UV618/256 is extended with a frequency divider (division ratio of 256), with inputs connected to the v.h.f. and u.h.f. oscillator. The symmetrical ECL outputs are connected to terminals 13 and 14.
V.H.F./U.H.F. television tuners

UV617
UV618/256

Fig. 1.
For type UV617 delete: C71, C72, C86, C87, R88, R71, R72, IC2.
For connections see next page.
Unless otherwise stated the tolerance is ±0,05 mm.

**Terminal**

- **A** = aerial input (IEC female 75 Ω)
- **5** = a.g.c. voltage, +9,2 to +0,85 V
- **6** = supply voltage, tuning part, +12 V
- **7** = supply voltage, low v.h.f. +12 V
- **8** = supply voltage, high v.h.f., +12 V
- **10** = supply voltage, u.h.f., +12 V
- **11** = tuning voltage, +0,8 to +28 V
- **12** = supply voltage, frequency divider, +5 V
- **13,14** = balanced output voltage of frequency divider (1 kΩ) only for UV618/256
- **15** = earth
- **16** = i.f. output, symm. (approx. 75 Ω)
- **17** =
V.H.F./U.H.F. television tuners

Mass
approx. 95 g

Mounting
The tuner may be mounted by soldering it on to a printed-wiring board (using the piercing diagram shown in Fig. 3) without clearance between tuner supporting surface and board. The connection pins should be bent according to Fig. 4. The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta (230 ± 10 °C, 2 ± 0,5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board. Unless otherwise stated the tolerance is ± 0,05 mm.

Fig. 4.
In order to prevent any stress to the printed-wiring board, the tuner should be supported at its aerial connector.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0,3 V and an a.g.c. voltage of 9,2 ± 0,2 V.

General

Semiconductors, v.h.f. bands
- r.f. amplifier: BF992
- mixer: TDA5030
- oscillator
- tuning diodes
- switching diodes
- d.c. blocking diodes: 7 x OF633, 4 x BA482/483/484, 2 x BAS15

Semiconductors, u.h.f. bands
- r.f. amplifier: BF990
- oscillator: BF970
- mixer: 1SS99
- tuning diodes
- frequency divider
- frequency divider: 4 x OF643, SP4653

Ambient temperature range
- operating: −10 to +60 °C
- storage: −25 to +85 °C

Relative humidity
- max. 95%

Voltages and currents

Supply voltage
- + 12 V ± 10%

Current drawn from + 12 V supply
- v.h.f. bands: max. 50 mA
- u.h.f. bands: max. 45 mA

Bandswitching
- max. 15 mA

For operation in all bands the supply voltage is permanently connected to terminal 6. Additionally the supply voltage is connected to:
- terminal 7 for operation in low v.h.f. band
- terminal 8 for operation in high v.h.f. band
- terminal 10 for operation in u.h.f. bands

A.G.C. voltage (Figs 4, 5 and 6)
- voltage range: + 9,2 to + 0,85 V (max. 30 µA)
- voltage at nominal gain: + 9,2 ± 0,5 V
- voltage at 40 dB gain reduction
- low v.h.f. band
- high v.h.f. band
- voltage at 30 dB gain reduction
- u.h.f. band

Typ. 3 V
Typ. 2 V
Typ. 2 V

Note: A.G.C. voltage between 0 and + 10,5 V may be applied without risk of damage.

A.G.C. current
- max. 0,03 mA

Slope of a.g.c. characteristic,
at the end of the specified a.g.c. range
- low v.h.f. bands
- high v.h.f. bands
- typ. 40 dB/V
- typ. 80 dB/V
V.H.F./U.H.F. television tuners

Tuning voltage range (Figs 7, 8 and 9) +0.8 to +28 V

Current drawn from 28 V tuning voltage supply
at $T_{amb} = 25\,^\circ C$ and 60% R.H. max. 0.5 $\mu$A
at $T_{amb} = 25\,^\circ C$ and 95% R.H. max. 2 $\mu$A
at $T_{amb} = 60\,^\circ C$ and 60% R.H. max. 2 $\mu$A

Note: The source impedance of the tuning voltage offered to terminal 11 must be maximum 47 k$\Omega$.

min. 66 dB; typ. 70 dB
u.h.f. bands
min. 53 dB; typ. 60 dB
V.H.F./U.H.F. television tuners

I.F. rejection (measured at picture carrier frequency)
- low v.h.f. band: min. 60 dB
- high v.h.f. band: min. 60 dB
- u.h.f. bands: min. 60 dB

Note: At colour sub-carrier frequency maximum 6 dB less rejection.

Cross modulation
Input signal producing 1% cross modulation, i.e. 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)
- v.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV)): typ. 80 dB (µV) into 75 Ω
  - at 40 dB gain reduction (wanted input level 100 dB (µV)): typ. 100 dB (µV) into 75 Ω
- u.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV)): typ. 80 dB (µV) into 75 Ω
  - at 30 dB gain reduction (wanted input level 90 dB (µV)): typ. 100 dB (µV) into 75 Ω

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 2 for low v.h.f., or channel N ± 3 for high v.h.f., or channel N ± 5 for u.h.f.)
- v.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV)): typ. 95 dB (µV) into 75 Ω
  - at 40 dB gain reduction (wanted input level 100 dB (µV)): typ. 100 dB (µV) into 75 Ω
- u.h.f. bands
  - at nominal gain (wanted input level 60 dB (µV)): typ. 94 dB (µV) into 75 Ω
  - at 30 dB gain reduction (wanted input level 90 dB (µV)): typ. 100 dB (µV) into 75 Ω

Out of band cross modulation at nominal gain
- low v.h.f., interfering from high v.h.f.: typ. 100 dB (µV) into 75 Ω
- low v.h.f., interfering from u.h.f.: typ. 100 dB (µV) into 75 Ω
- high v.h.f., interfering from low v.h.f.: typ. 100 dB (µV) into 75 Ω
- high v.h.f., interfering from u.h.f.: typ. 100 dB (µV) into 75 Ω
- u.h.f. interfering from low v.h.f.: typ. 100 dB (µV) into 75 Ω
- u.h.f. interfering from high v.h.f.: typ. 100 dB (µV) into 75 Ω

Unwanted signal handling capability (visibility test)

For the channel combinations
- v.h.f.: N ± 1, N ± 5, N + 11
- u.h.f.: N ± 1, N ± 5, N + 9

The tuner meets the requirements of "Amtsblatt" DBP/1981, item 5.1.2., when measured in an adequate TV receiver. The a.g.c. circuit of the receiver has to be adjusted with an input signal of 74 dB (µV) on channel E60 in such a way, that the gain of the tuner is decreased by 10 dB.

APPLICATION

Designed to cover all channels of C.C.I.R. systems L and L’ including the cable channels C to Q for French cable television.

The i.f. output is designed for direct drive of a variety of SAW filters.

The tuner UV628/256 is equipped with a frequency divider, which makes it suitable for digital tuning systems based on frequency synthesis; for the remainder it is equal to type UV627.

UV627
UV628/256

DEVELOPMENT DATA

November 1986 249
DESCRIPTION

The UV627 and UV628/256 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering the low v.h.f. band (frequency range 48 to 68 MHz), the high v.h.f. band (frequency range 128 to 304 MHz), and the u.h.f. band (frequency range 470 to 860 MHz).

Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a die-cast metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common SNIR (9 mm) coaxial aerial connector (75 Ω) is integrated in one of the frame sides of the housing, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuners consist of v.h.f. and u.h.f. parts (see Fig. 1). They are equipped with a common aerial input and provided with tuned r.f. MOSFET input stages. The v.h.f. mixer, v.h.f. oscillator and i.f. amplifier functions are provided by a tuner IC. This IC has terminals between mixer and i.f. amplifier to connect i.f. preselections.

Output impedance of the symmetrical i.f. terminals is approx. 75 Ω to insure sufficient triple transient suppression of the SAW filter.

The r.f. band pass filter and oscillator circuits of the v.h.f. part are tuned by 9 tuning diodes; band switching is achieved by 6 switching diodes.

The u.h.f. part of the tuner has a high-pass input circuit, followed by a single tuned circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the i.f. pre-amplifier of the tuner IC.

The r.f. band pass filter and oscillator circuits are tuned by 4 tuning diodes.

In all bands the tuner is gain-controlled via gate 2 of the input MOSFET tetrode.

A two-pole filter is used to comply with SCART 109 recommendation regarding i.f. selectivity.

A test point TP1 is provided for i.f. injection.

The electrical circuit of the UV628/256 is extended with a frequency divider (division ratio of 256), with an input connected to the v.h.f. and u.h.f. oscillators. The symmetrical ECL outputs are connected to terminals 13 and 14.

  - t.b.f.
  - t.b.f.
Unwanted signal characteristics

Image rejection (measured at picture carrier frequency)
- low v.h.f. band: min. 40 dB
- high v.h.f. band: min. 60 dB
- u.h.f. bands: min. 40 dB

I.F. rejection (measured at picture carrier frequency)
- all bands, except low v.h.f. band (= min. 55 dB): min. 60 dB

Cross modulation
- Input signal producing 1% cross modulation, i.e., 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

In channel cross modulation (wanted signal: picture carrier frequency; interfering signal: sound carrier frequency)
- v.h.f. bands:
  - at nominal gain (wanted input level 60 dB (µV)): min. 70 dB (µV)
  - at 40 dB gain reduction (wanted input level 100 dB (µV)): t.b.f.
- u.h.f. bands:
  - at nominal gain (wanted input level 60 dB (µV)): min. 70 dB (µV)
  - at 30 dB gain reduction (wanted input level 90 dB (µV)): t.b.f.

In band cross modulation (wanted signal: picture carrier of channel N; interfering signal: picture carrier of channel N ± 2 for low v.h.f., or channel N ± 3 for high v.h.f., or channel N ± 5 for u.h.f.).
- v.h.f. bands:
  - at nominal gain (wanted input level 60 dB (µV)): t.b.f.
  - at 40 dB gain reduction (wanted input level 100 dB (µV)): t.b.f.
- u.h.f. bands:
  - at nominal gain (wanted input level 60 dB (µV)): t.b.f.
  - at 30 dB gain reduction (wanted input level 90 dB (µV)): t.b.f.

Out of band cross modulation at nominal gain
- each of the v.h.f. or u.h.f. bands interfering with any of the other bands mentioned: t.b.f.

Oscillator characteristics

Oscillator voltage at aerial input
- v.h.f. bands: max. 50 dB (µV)
- u.h.f. bands: max. 66 dB (µV)

Oscillator voltage at the terminals
- supply and control pins: t.b.f.
- i.f. terminals for:
  - v.h.f.: t.b.f.
  - u.h.f.: t.b.f.

Pulling
- Input signal of tuned frequency producing a shift of the oscillator frequency of 10 kHz,
  - at nominal gain all bands: typ. 69 dB (µV) into 75 Ω

256 November 1986
V.H.F./U.H.F. television tuners

**Shift of oscillator frequency at a change of the supply voltage of 5%**
- v.h.f. bands max. 500 kHz
- u.h.f. bands max. 700 kHz
- during a.g.c. max. 150 kHz

**Drift of oscillator frequency**
- during warm-up time (after the tuner has been completely out of operation for 15 min, measured between 5 s and 15 min after switching on) max. 300 kHz
- during warm-up time (after the input stage is in operation for 15 min, measured between 2 s and 15 min after band switching) max. 250 kHz
- at a change of the ambient temperature from +25 to +40 °C (measured after 3 cycles from +25 to 0 °C) t.b.f.
- at a change of humidity from 60 ± 15% to 93 ± 2%, at $T_{amb} = 25 ± 5 °C$
  - t.b.f.
  - low v.h.f. band 500 kHz
  - high v.h.f. band 1000 kHz

Both tuners comply with the requirements of radiation, signal handling capability, and immunity from radiated interference of FCC.
Fig. 1 Circuit diagram.
DESCRIPTION

The UV635 and UV636/256 are combined v.h.f./u.h.f. tuners with electronic tuning and band switching, covering a large frequency range in four parts: range a, from 55,25 MHz to 115,25 MHz; range b, from 121,25 to 277,25 MHz; range c, from 283,25 to 403,25 MHz; range d, from 409,25 to 801,25 MHz. See also under “Frequencies”.

Mechanically, the tuners are built on a low-loss printed-wiring board, carrying all components, in a die-cast metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common phono coaxial aerial connector (75 Ω) is situated on one of the frame sides of the housing, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuners consist of v.h.f., hyperband and u.h.f. parts (see Fig. 1). They are equipped with a common aerial input and provided with tuned r.f. MOSFET input stages. The mixer and oscillator for the ranges a, b and c, and i.f. amplifier functions are provided by a tuner IC. This IC has terminals between mixer and i.f. amplifier to connect i.f. preselections, a 47,25 MHz trap is provided to improve the selectivity of common SAW filters for adjacent channel N - 1 (system B).

Output impedance of the symmetrical i.f. terminals is approx. 75 Ω to insure sufficient triple transient suppression of the SAW filter.

The r.f. band pass filter and oscillator circuits of the v.h.f. part are tuned by 5 tuning diodes; band switching is achieved by 5 switching diodes, those of the hyperband by 4 tuning diodes and 3 switching diodes respectively.

The u.h.f. part of the tuner has a tuned input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the i.f. pre-amplifier of the tuner IC.

The r.f. band pass filter and oscillator circuits are tuned by 4 tuning diodes.

In all bands the tuner is gain-controlled via gate 2 of the input MOSFET tetrode.

A test point TP1 is provided for i.f. injection.

The electrical circuit of the UV636/256 is extended with a frequency divider (division ratio of 256), with an input connected to both oscillators. The symmetrical ECL outputs are connected to terminals 13 and 14.

- voltage range: + 9,2 to 0,85 V
- voltage at nominal gain: + 9,2 ± 0,5 V
- voltage at 45 dB gain reduction: typ. 3 V
- voltage at 30 dB gain reduction: typ. 2 V
- range c:
- range d:

Note: A.G.C. voltage between 0 and + 10,5 V may be applied without risk of damage.

A.G.C. current: max. 30 µA

Slope of a.g.c. characteristic
- at the end of the specified a.g.c. range:
  - range a: typ. 40 dB/V
  - ranges b and c: typ. 70 dB/V
  - range d: typ. 80 dB/V

A.G.C. time constant: max. 8 ms

A.G.C. source impedance: max. 10 kΩ

Tuning voltage range: + 0,8 to + 28 V

Current drawn from 28 V tuning voltage supply
- at T_{amb} = 25 °C and 60% R.H.: max. 0,5 µA
- at T_{amb} = 25 °C and 95% R.H.: max. 2 µA
- at T_{amb} = 60 °C and 60% R.H.: max. 2 µA

Note: The source impedance of the tuning voltage offered to terminal 11 must be maximum 47 kΩ.

Slope of tuning characteristic
- range a: 1 to 6 MHz/V
- range b: 2 to 14 MHz/V
- range c: 3 to 20 MHz/V
- range d: 4 to 25 MHz/V

The tuner has a built-in current limitation (≤ 100 µA per varicap diode) for tuning voltages up to + 35 V, which can be applied during search tuning.

Frequencies
- Frequency ranges, picture carrier
  - Off-air:
    - low v.h.f. band: channel A2 (55,25 MHz) to channel A6 (83,25 MHz).
    - Margin at the extreme channels: min. 2 MHz.
    - high v.h.f. band: channel A7 (175,25 MHz) to channel A13 (211,25 MHz).
    - Margin at the extreme channels: min. 2 MHz.
    - u.h.f. band: channel A14 (471,25 MHz) to channel A69 (801,25 MHz).
    - Margin at the extreme channels: min. 3 MHz.

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems L and L’.

The tuner UVF10A is equipped with a frequency divider (1 : 256), which makes it suitable for digital tuning systems based on frequency synthesis; otherwise this tuner is equal to type UVF10.
DESCRIPTION

The UVF10 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching covering the v.h.f. band I including the European channel E4 (frequency range 41 to 68 MHz), the v.h.f. band III including the Moroccan channel M4 and the European channel E12 (frequency range 162 to 230 MHz) and the u.h.f. band (frequency range 470 to 861 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear covers (see Fig. 2). The common aerial connection (v.h.f. and u.h.f.) with standard coaxial termination is on one of the frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages, i.f. output) are made via terminals in the underside. The mounting method is shown in Fig. 3.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via switchable v.h.f. band I/III wideband input filters to gate 1 of an input MOSFET tetrode (with internal gate protection against surge).

The drain load of the MOSFET tetrode is formed by a double tuned switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is coupled out of the tuner. A test point (terminal 4) is provided for i.f. injection to align the output circuit of the tuner together with the i.f. amplifier of the television receiver.

The input tuned circuit, the r.f. bandpass filter and oscillator circuit are tuned by 4 tuning diodes, band switching is achieved by 8 switching diodes.

The u.h.f. part of the tuner consists of a tuned input circuit connected to gate 1 of an input MOSFET tetrode (with internal gate protection against surge). The drain load of this MOSFET tetrode is formed by a double tuned circuit transferring the r.f. signal to the Schottky barrier mixer diode. The i.f. signal from the mixer diode is amplified by the v.h.f. mixer transistor, now operating as an i.f. amplifier.

The input tuned circuit, the r.f. bandpass filter and oscillator circuits are tuned by 4 tuning diodes. In all bands the tuner is gain controlled via gate 2 of the input MOSFET tetrodes.

ADDITIONAL INFORMATION

I.F. injection
Terminal 4 (supply voltage u.h.f.) can be used as i.f. injection point, provided the u.h.f. supply voltage is applied to terminal 4 via a resistor of 56 Ω (see Fig. 10). The u.h.f. band should be switched on; a tuning voltage of −12 V is applied to terminal 7.

![Fig. 10.](image)

Connection of the i.f. amplifier
No special precautions are required to load and to match the i.f. output of the tuner.

Measuring method of power gain
The i.f. output of the tuner should be terminated with the circuit given in Fig. 11.

![Fig. 11.](image)

This circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit (Fig. 12).

Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and the circuit between a 75 Ω source and a 75 Ω detector.
Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 13. A suitable tool is available under catalogue number 7122 005 47680.

## APPLICATION

This tuner is designed to cover the v.h.f. channels of C.C.I.R. systems M and N (R.T.M.A.).

It can be provided with a frequency divider, which makes this tuner suitable for digital tuning systems based on frequency synthesis.
DESCRIPTION

This v.h.f. tuner has electronic tuning and band switching, covering the low v.h.f. band channels A2 to A6 (frequency range 54 to 88 MHz) and the high v.h.f. band channels A7 to A13 (frequency range 174 to 216 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2a). All connections (supply voltage, a.g.c. voltage, tuning voltage, band switching, i.f. output) are made via terminals on the underside, except the coaxial aerial connection of 75 Ω which is on one of the frame sides. The mounting method is shown in Fig. 3.

Electrically the v.h.f. aerial signal is fed via low pass, high pass, i.f. and f.m. suppression filters to a switchable single tuned input circuit for low and high v.h.f. operation, which is capacitively coupled to the gate 1 of a MOS-FET tetrode (with internal gate protection against surge). The drain load of the MOS-FET tetrode is formed by a double tuned, switchable bandpass filter, transferring the r.f. signal to the emitter of the mixer transistor. The oscillator signal is also fed to the emitter of the mixer transistor.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, where the i.f. signal is coupled out at the low impedance side.

A test point (terminal 4) is provided for i.f. injection to adjust the i.f. output circuit of the tuner together with the i.f. amplifier of a television receiver. An additional test point, which is accessible through a hole in the top of the frame, is connected with the collector of the v.h.f. mixer transistor.

The single tuned input, the r.f. bandpass filter and oscillator circuits are tuned by 4 varicap diodes, band switching is achieved by switching diodes.

The tuner is gain controlled via gate 2 of the input MOS-FET tetrode.

Fig. 2a. Torque for alignment: 2 to 15 mNm
Press-through force: ≥ 10 N

Fig. 2b. I.F. output coil.
Mass approx. 125 g.

Mounting
The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta (230 ± 10 °C, 2 ± 0,5 s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

Marking
The tuner is provided with a label showing the following data:
- type number V431
- catalogue number 3112 218 51830
- code for factory of origin
- change code
- code for year and week of production

Fig. 3 Piercing diagram viewed from solder side of board. Unless otherwise stated the tolerance is ± 0,05 mm.
ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5°C, a relative humidity of 60 ± 15%, a supply voltage of 12 ± 0.3 V and an a.g.c. voltage of 9.2 ± 0.2 V.

General

Semiconductors
- r.f. amplifier: BF982
- mixer: BF324
- oscillator: BF926
- tuning diodes: 4 x BB809
- switching diodes: 4 x BA482/483/484
- d.c. blocking diodes: 3 x BAW62

Ambient temperature range
- operating: 0 to +60 °C
- storage: -25 to +70 °C

Relative humidity: max. 95%

Voltage and currents

Supply voltage: +12 V ± 10%*

Current drawn from +12 V supply
- low v.h.f.: max. 52 mA; typ. 39 mA
- high v.h.f.: max. 52 mA; typ. 39 mA

Bandswitching
For operation in both bands the supply voltage is permanently connected to terminal 6. Additionally the supply voltage is connected to:
- terminal 2 for operation in the low v.h.f. band,
- terminal 3 for operation in the high v.h.f. band,
- terminal 4 for i.f. injection

A.G.C. voltage
- voltage range: +9.2 to +0.85 V
- voltage at nominal gain: +9 ± 0.5 V
- voltage at 40 dB gain reduction
  - low v.h.f.: typ. 3.2 V
  - high v.h.f.: typ. 1.5 V

Note: A.G.C. voltages between 0 and +10.5 V may be applied without risk of damage.

A.G.C. current: max. 0.1 mA

Slope of a.g.c. characteristic,
- at the end of the specified a.g.c. range: typ. 25 dB/V

* A tolerance of −15% on the supply voltage is admissible, if a deterioration of gain, noise figure, oscillator shift and oscillator drift is acceptable.
V.H.F. television tuner

Tuning voltage range (Figs 4 and 5) +1 to +28 V

V.H.F. television tuner
I.F. circuit characteristics

Bandwidth of i.f. output circuit 5 ± 0,5 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 8; tuning voltage 15 V, high v.h.f. band switched on.

Bandwidth variation of i.f. output circuit as a result of r.f. tuning and band switching (reference: high v.h.f., tuning voltage 15 V; i.f. output circuit adjusted to 43,5 MHz) max. 650 kHz

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 8, i.e. a 100 pF capacitor is connected in parallel with the i.f. output of the tuner.

![Fig. 8.]

Detuning of the i.f. output circuit as a result of r.f. tuning and band switching (reference: high v.h.f., tuning voltage 15 V; i.f. output circuit adjusted to 43,5 MHz) max. 300 kHz

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 8, i.e. a 100 pF capacitor is connected in parallel with the i.f. output of the tuner.

Minimum tuning range of i.f. output coil 41 to 47 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 8. The tuner is supplied with the i.f. output circuit adjusted to 43,5 ± 1 MHz.

Attenuation between i.f. injection point and i.f. output of the tuner typ. 16 dB

Miscellaneous

Radio interference:
Oscillator radiation and oscillator voltage at the aerial terminal Within the limits of C.I.S.P.R. 13 (1975)

Microphonics
There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection:
Protection against voltages max. 5 kV

Note: 10 discharges of a 470 pF capacitor into the aerial terminal.
V.H.F. television tuner

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

I.F. injection

Terminal 4 can be used as i.f. injection point. The i.f. generator is connected according to Fig. 9. High v.h.f. should be switched on; tuning voltage should be 15 V.

![Fig. 9.](image)

Connection of the i.f. amplifier

— By means of a print track as short as possible.
— By means of a shielded track, e.g. a coaxial cable.

Connection of supply voltages

![Fig. 10.](image)
Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 8.

![Fig. 11](image)

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit which should be tuned to 43,5 MHz; the bandwidth is approx. 5 MHz (Fig. 11).

Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 12. A suitable tool is available under catalogue number 7122 005 47680.

APPLICATION

This coaxial aerial input assembly has been developed for application in TV sets without mains separation and provided with a television tuner of the UV400 family. Thanks to the use of safety capacitors in the assembly, the chassis of the TV set is separated from the aerial input. The input connector of the assembly meets the demands of IEC 169.2 and DIN 45325 (diameter 9.5 mm).

The coaxial aerial input assembly complies with the requirements of immunity from radiated interference of Amtsblatt DBP69/1981. It meets the safety requirements of IEC 65; approbation approval has been sought from VDE.

DESCRIPTION

The assembly is provided with safety capacitors, which are moulded in thermo-setting insulation material, thus forming capacitor blocks. These capacitor blocks are built in a metal housing with cover, and are connected to the housing, coaxial cable and the output plug (see Fig. 1). The coaxial cable is a double insulated, screened 75 Ω cable, which leads to the female input connector on a plastic plate. The output connector (phono) is mounted on the housing and fits the aerial input of the tuner (see Fig. 2).

The assembly can be supplied with three cable lengths:

ELECTRICAL DATA

The electrical values are measured at an ambient temperature of 25 ± 5 °C and a relative humidity of 60 ± 15%.

Impedance of input connector: 75 Ω, asymmetric
Impedance of output plug: 75 Ω, asymmetric
Frequency range: 40 to 890 MHz

Reflection at the input connector, output plug matched with phono connector 3122 128 74660 and 75 n:
- 40 to 470 MHz: ≤ 25%
- 470 to 700 MHz: ≤ 35%
- 700 to 890 MHz: ≤ 45%

Reflection at the output plug, input connector matched with IEC plug and 75 n:
- 40 to 470 MHz: ≤ 25%
- 470 to 700 MHz: ≤ 35%
- 700 to 890 MHz: ≤ 45%

Insertion loss:
- 40 to 700 MHz: max. 1.5 dB, typ. 0.6 dB
- 700 to 890 MHz: max. 2.0 dB, typ. 1.4 dB

Contact resistance of input connector:
- inner conductor: ≤ 10 mΩ
- outer conductor: ≤ 5 mΩ

Contact resistance of output plug:
- inner conductor: ≤ 10 mΩ
- outer conductor: ≤ 10 mΩ

Insulation resistance: ≤ 500 MΩ

Immunity from radiated interference: in conformity with requirements of Amtsblatt DBP69/1981 provided the unit is connected to a television tuner of the UV400 family in the right way.

Safety:
- the unit meets the requirements of IEC 65, 4th edition, clause 14.2. Approbation approval has been sought from VDE. Quality assessment in production centres is according to the rules of VDE.

ENVIRONMENTAL CONDITIONS

Operating temperature range: 0 to +55 °C
Storage temperature range: -40 to +70 °C
Relative humidity: ≤ 95%
Maximum bump acceleration: 245 m/s² (25g)
Maximum shock acceleration: 490 m/s² (50g)
Maximum vibration amplitude: 0.35 mm
Coaxial aerial input assembly

MECHANICAL DATA

Dimensions in mm

Fig. 2.

Mass 50 g approximately

MOUNTING

The metal housing is connected to the television tuner of the UV400 family by inserting the phono plug into the aerial input plug of the tuner. The plastic plate with input connector can be fixed by means of two M3 screws (13 mm) or by using a snap-in holder.

It is advised not to use aluminium plugs.

Insertion force

- input connector max. 50 N
- inner conductor of output plug max. 30 N

Pull-out force

- input connector 10 to 50 N
- inner conductor of output plug min. 3 N

Tensile strength to cable connections at both sides max. 100 N

COAXIAL AERIAL INPUT ASSEMBLY

APPLICATION
These coaxial aerial input assemblies have been developed for application in television sets with 75 ohm input impedance, for use in v.h.f. as well as in u.h.f. (40-890 MHz). The connectors meet the demands of both the IEC standards (diameter 9.5 mm) and the French standards (diameter 9.0 mm). They have to be used with plugs complying with the properties mentioned in DIN 45325, IEC 169-2 (diameter 9.5 mm) and SNIR (diameter 9.0 mm). The units meet the safety requirements of IEC 65.

COAXIAL AERIAL INPUT ASSEMBLY

APPLICATION
This coaxial aerial input assembly has been developed for application in TV sets with 75 Ω input impedance, for use in v.h.f. as well as in u.h.f. bands. Thanks to the use of safety capacitors in the assembly, the chassis of the TV set is separated from the aerial input. The connector for the aerial input meets the demands of the IEC standards (diameter 9,5 mm) and the French standards (diameter 9,0 mm).

The coaxial aerial input assembly complies with the requirements of immunity from radiated interference of BS 905. It meets the safety requirements of IEC 65; approbation approvals have been sought from KEMA, VDE, SEV, BSI, DEMKO, NEMKO, SEMKO, EI and LCEE.

DESCRIPTION
The assembly is provided with safety capacitors, which are moulded in thermo-setting insulation material, thus forming a capacitor block. This capacitor block is built in a metal housing, with lid, which is carried by a plastic fixing plate. All points to the safety capacitors are press contacts, achieved by the metal housing. The housing has an outlet for the coaxial cable to the television tuner.
ELECTRICAL DATA

The electrical values are measured at an ambient temperature of 25 ± 5 °C and a relative humidity of 60 ± 15%.

Input impedance of connector: 75 Ω, asymmetrical.

Frequency ranges:
  - v.h.f.: 40 to 300 MHz
  - u.h.f.: 470 to 890 MHz

  - v.h.f.: ≤ 15%
  - u.h.f.: ≤ 25%

Insertion loss:
  - v.h.f.: ≤ 1 dB; typ. 0.2 dB
  - u.h.f.: ≤ 1 dB; typ. 0.4 dB

Contact resistance of connector after 1 plug insertion:
  - inner bush: ≤ 10 mΩ
  - outer bush: ≤ 5 mΩ

Insulation resistance: > 500 MΩ

Immunity from radiated interference:
  - in conformity with requirements of BS 905, provided the assembly is installed in a professional manner, and a proper coaxial cable is used.

MOUNTING

The assembly can be mounted to the chassis of the TV set with two self-tapping screws, 4N x 9,5.

It must be connected to the tuner via a coaxial cable with a diameter of 3 mm. The inner cable conductor should be soldered to the metal plating of the capacitor block, and the cable earth sheath to the metal housing, see Fig. 3.

The soldering conditions are: 340 °C, 2 s.

Plugs to be used with the assembly have to comply with the properties mentioned in DIN 45325, IEC 69-2 (9,5 mm diameter) and SNIR (9 mm diameter).

It is advised not to use aluminium plugs.
Fig. 3 Recommended fixing of the aerial cable.

Fig. 4 Recommended cable stripping.
COAXIAL AERIAL INPUT ASSEMBLY

APPLICATION
This coaxial aerial input assembly has been developed for application in TV sets with 75 Ω input impedance, for use in v.h.f. as well as in u.h.f. bands. Thanks to the use of safety capacitors in the assembly, the chassis of the TV set is separated from the aerial input. The connector for the aerial input meets the demands of the IEC standards (diameter 9,5 mm) and the French standards (diameter 9,0 mm).

The coaxial aerial input assembly complies with the requirements of immunity from radiated interference of BS 905. It meets the safety requirements of IEC 65; approbation approvals have been sought from KEMA, VDE, SEV, BSI, DEMKO, NEMKO, SEMKO, EI and LCEE.

DESCRIPTION
The assembly is provided with safety capacitors, which are moulded in thermo-setting insulation material, thus forming a capacitor block. This capacitor block is built in a metal housing with lid, which is carried by a plastic fixing plate. All points to the safety capacitors are press contacts, achieved by the metal housing. A printed circuit board containing a splitter for v.h.f. and u.h.f. signals is built in the housing. The housing has two outlets for coaxial cables to the television tuner.

Fig. 1 Electrical diagram.
ELECTRICAL DATA

The electrical values are measured at an ambient temperature of 25 ± 5 °C and a relative humidity of 60 ± 15%.

Input impedance of connector
- 75 Ω, asymmetrical

Frequency ranges
- v.h.f.: 40 to 300 MHz
- u.h.f.: 470 to 890 MHz

Reflection
- v.h.f.; u.h.f. output terminated with 75 Ω ≤ 30%
- u.h.f.; v.h.f. output terminated with 75 Ω ≤ 30%

Insertion loss
- v.h.f., 40 – 230 MHz ≤ 1 dB; typ. 0.7 dB
- v.h.f., 230 – 300 MHz, u.h.f. terminated with 75 Ω ≤ 1.5 dB; typ. 1.2 dB
- u.h.f., v.h.f. terminated with 75 Ω ≤ 1.5 dB, typ. 0.9 dB

Suppression
- of u.h.f. frequencies at v.h.f. output
  - 40 – 230 MHz > 15 dB
  - 230 – 300 MHz > 10 dB
  - measured at
    - 40 MHz typ. 50 dB
    - 200 MHz typ. 22 dB
    - 230 MHz typ. 18 dB
    - 300 MHz typ. 11 dB
- of v.h.f. frequencies at u.h.f. output
  - 470 – 890 MHz > 13 dB
  - measured at
    - 470 MHz typ. 14 dB
    - 700 MHz typ. 21 dB
    - 890 MHz typ. 22 dB

Contact resistance of connector
- after 1 plug insertion
  - inner bush: ≤ 10 mΩ
  - outer bush: ≤ 5 mΩ

Insulation resistance
- > 500 MΩ

Immunity from radiated interference
- in conformity with requirements of BS 905, provided the assembly is installed in a professional manner, and a proper coaxial cable is used.
Quality assessment in production centres are according to the rules of BSI and VDE.

**ENVIRONMENTAL DATA**

- Operating temperature range: 0 to +55 °C
- Storage temperature range: -40 to +85 °C
- Relative humidity: ≤ 95%
- Maximum bump acceleration: 25g
- Maximum shock acceleration: 50g
- Maximum vibration amplitude: 0,35 mm

**MECHANICAL DATA**

Fig. 2.

Mass: 26 g approximately

Dimensions in mm
Connector

Insertion force ≤ 50 N

Pull-out force 10 to 50 N

Pull-out force of inner bush, measured with a min. gauge of 2,29 mm dia., after 5 insertions of a max. plug gauge of 2,43 mm dia. ≥ 1 N

Loading of inner bush in axial direction for 5 s ≤ 50 N

Pull-out force of outer bush, measured with a min. plug gauge of 9 mm dia., after 5 insertions of a max. plug gauge of 9,5 mm dia. ≥ 1,5 N

Loading of outer bush in 4 radial and axial directions for 5 s ≤ 50 N

Marking

Moulded at the front of the fixing plate:
- PHILIPS
- 7105 (for the National Approbation Offices regarding the safety aspects)
- 250 V~, 390 pF 3x

Punched into one of the side faces of the metal housing:
- letter code for factory of origin
- production date code (year and week)

MOUNTING

The assembly can be mounted to the chassis of the TV set with two self-tapping screws, 4N x 9,5.

It must be connected to the tuner via coaxial cables with a diameter of 3 mm stripped according to Fig. 3. The inner cable conductors should be soldered to the inputs of splitters which line up with the cable inlets, the cable earth sheaths soldered to the metal housing.

The soldering conditions are: 340 °C, 2 s.

Plugs to be used with the assembly have to comply with the properties mentioned in DIN 45325, IEC 69-2 (9,5 mm diameter) and SNIR (9 mm diameter).

It is advised not to use aluminium plugs.

Fig. 3 Recommended cable stripping.
Cable length max. 150 mm.
