The fastest way through customs.

The FPGA design language of choice. CUPL/IST™ (Integrated Synthesis Tools) is your fastest way through customs. It's your best alternative to get designs as large as 50,000 gates into FPGA devices. CUPL's Multiple State Machine syntax allows you to specify a large design in high level expressions quickly and concisely without gate level concerns. Inquire about how CUPL/IST lets you develop Xilinx, PlusLogic, AMD MACH, Altera MAX, Actel, TI, and AT&T FPGA devices.

Our Open-PLA™ environment is a natural development facility for integrating device specific back-end routers and optimizers to CUPL's design entry synthesis tools. We support every technology, every architecture from every device manufacturer. Our involvement and close relationship with all manufacturers of programmable devices ensures you that technology trends and support are available when you need them.

Low-Med-High Density PLDs. CUPL 4.0 is your best choice for PLDs. It can create JEDEC files for just about any PLD device on the market today, and handles designs as large as 2500 gates. It takes you quickly from schematic, truth table, state machine, and Boolean equations to JEDEC in just a few seconds on any platform.

Workstations. CUPL is once again your best choice for workstations. It's available for MS-DOS, VAX-VMS, Unix C, Sun Sparc, HP/Apollo, and the Macintosh.

Expertise, and not expensive, is what CUPL offers in this sophisticated vertical industry. CUPL also integrates well with Mentor, Valid, Racal, Viewlogic, and other CAE platforms.

The Universal Approach. CUPL, the most universal of all logic design tools, has been adopted by many educational institutions, corporations and research labs as the "de facto" standard language for programmable logic development.

Now, find errors fast, with a portable 1 GSa/s scope that gets right to the point.

At $10,950*, you won't find a better value in a digitizing scope.
When you need to troubleshoot and debug digital designs fast, you can't afford to miss a thing. And now, you don't have to.
The HP 54510A looks at a billion samples a second with a time-qualified pattern triggering and an infinite persistence display to pinpoint rare events and elusive glitches the instant they happen.

You don't have to stick around to watch, either. The HP 54510A has 8k of memory per channel to capture and store single events. So, you can go back and get all the details you need—with razor-sharp, 8-bit resolution—and track the problem to its source. And to point you to the right solution, the HP 54510A gives you 17 pulse-parameter measurements, with better horizontal and vertical accuracy than the Tek DSA 602, at one-third of the cost.

So, if you're looking for a solution to high-speed troubleshooting, call 1-800-752-0900**. Ask for Ext. 1902, and we'll send you an application note on the HP 54510A that shows you how to find faults fast.

*U.S. price only.

SPDT switch  dc to 5GHz with built-in driver

Truly incredible…a superfast 3nsec GaAs SPDT reflective switch with a built-in driver for only $19.95. So why bothered designing and building a driver interface to further complicate your subsystem and take added space when you can specify Mini-Circuits’ YSW-2-50DR?

Check the outstanding performance specs of the rugged device, housed in a tiny plastic case, over a -55° to +85°C span. Unit-to-unit repeatability for insertion loss is 3-sigma guaranteed, which means less than 15 of a 10,000-unit production run will come close to the spec limit. Available for immediate delivery in tape-and-reel format for automatic placement equipment.

New…ZYSW-2-50DR Connector Version (SMA) available, $59.95 (1-9)

CIRCLE NO. 7
Our tough SBL-mixers just got tougher, by including Mini-Circuits’ exclusive Ultra-Rel diodes that can endure 160 hours of test at a scorching 300°C. Rugged, more reliable mixers in your systems lower production and test costs and increase systems reliability.

Over the past fifteen years, millions of SBL-units were installed in formidable industrial and commercial applications. Under severe operating conditions, they have earned the reputation as the world’s most widely accepted mixers, based on quality, consistent performance in the field, and lowest cost.

In addition to the Ultra-Rel diodes, each SBL contains components that can withstand the strenuous shock and vibration requirements of MIL-STD-28837 along with more than 200 cycles of thermal shock extending from -55 to +100°C. Every Ultra-Rel™ SBL-mixer carries a five-year guarantee.

Unprecedented 4.5 sigma unit-to-unit repeatability is also guaranteed, meaning units ordered today and next year will provide performance identical to those delivered last year.

Tougher SBL-mixers, spanning 25KHz to 2000MHz, with +7dBm, +10dBm, and +13dBm LO models, priced from $4.50 (10 qty) are available only from Mini-Circuits. Don’t settle for a substitute or equivalent...insist on Ultra-Rel™ SBLs.

SPECIAL REPORT

Special-feature SRAMs

Each successive SRAM generation must be faster, denser, and wider to keep pace with the latest CPU speeds and architectures. Innovative SRAM architectures are often the means by which memory subsystems stay in the running with today's µPs. —John Gallant, Associate Editor

DESIGN FEATURES

Build a single-shot recorder to catch fast transients

By using an A/D converter with a high input bandwidth and oversampling at a 10:1 ratio, you can digitize and analyze fast transients without using an expensive storage scope. —Ken Deevy, Dan Sheehan, and Mike Byrne, Analog Devices Inc

Feedback models reduce op-amp circuits to voltage dividers

By extending an op amp's limited feedback model you can create a generalized model that reduces op-amp circuit analysis to determining voltage-divider ratios. —Jerald Graeme, Burr-Brown Corp

TECHNOLOGY UPDATES

Low-bias-current op amps: Femtoamperes fuel multifarious functions

Op amps with miniscule input bias current reside in a diversity of measuring instruments. In application, the main problem is channeling all, and only, sensor current to the op amp's input. —Brian Kerridge, European Editor

Credit-card-sized memories: Small memories take on broader applications

Robust, credit-card-sized memory cards let you carry around—and control access to—a pocketful of nonvolatile data or programs. Backed by new introductions and new standards, these memories may become more popular. —Charles H Small, Senior Editor

EDN's SOFTWARE ENGINEERING
SPECIAL SUPPLEMENT
Don't miss our Software Engineering Special Supplement packaged with this issue. As software gains in importance, complexity, and cost, your need for information about software also increases. EDN keeps you up-to-date with this latest software coverage.

Cahners Publishing Company, A Division of Reed Publishing USA}
OrCAD has introduced the greatest product upgrade in its history. Memory limits, design restrictions, even boundaries between products are all disappearing.

For years, OrCAD’s competitors have been playing a game of catch-up. With the introduction of Release IV, the race is over. No one will match our price/performance ratio on these features:

- Schematic Parts Library has been increased to over 20,000 unique library parts
- Digital Simulation process has been speeded up by an order of magnitude
- Printed Circuit Board Layout package offers autoplacement and autorouting at no extra charge
- Expanded memory capabilities

Best of all, OrCAD introduces ESP

ESP is a graphical environment designed specifically for the electronic designer. Software tools appropriate for different stages in the design process are now linked together to form a seamless flow of information. This easy-to-use framework relieves the designer of time consuming tasks and the inconvenience of moving from one tool set to another. You can now spend more time productively designing.

For more information . . .

You need to know more about Release IV and all of the benefits OrCAD has to offer. Call the telephone number below and we’ll send you a free demonstration disk.

For more information, call (503) 690-9881

or write to OrCAD Sales Department, 3175 N.W. Aloclek Drive, Hillsboro, Oregon, 97124
The Rumors are Flying!

OrCAD has released the ESP framework for the DOS environment. EDA departments all over the world are using OrCAD's Release IV software to design faster, better, for less money.

But . . .

The industry is buzzing about something else. It seems that this design tool manufacturer is once again breaking ground. OrCAD is working with the leader of the workstation industry: Sun Microsystems.

That's right, OrCAD EDA tools on the SPARC® platform. If you want to get information (and who wouldn't?), call (503) 690-9881.

OrCAD®
More Designs From More Designers
Today, you’re producing more manuals, proposals and documents than ever before, relying on resources and workgroups in a growing number of places. Your challenge: managing it all.

With Digital’s new Open Publishing, you can now have full control over documents. It’s our comprehensive approach to creating, storing, accessing, routing, revising and distributing documents companywide.

Example—your latest business proposal. You need to combine engineering and manufacturing specs, financial data and marketing and legal support text from different cities and different systems. Open Publishing now makes it easy. Easy to share and integrate information among members of workgroups, no matter where they

are. Easy to route the document information to the team. Easy for them to access and retrieve it quickly. It’s easier because Open Publishing is based on Digital’s Network Application Support (NAS), a set of open standards for sharing information and applications across multi-vendor systems.

Best of all, your proposal is a complete, accurate, better looking document that’s on schedule.

If you get the idea Open Publishing is a comprehensive solution, you’re right. It’s today’s fullest set of document management products for helping you control the whole process.

To learn more, ask your local Digital salesperson how Open Publishing can help you. For a FREE video, call 1-800-343-4040, ext. 402.

**THE OPEN ADVANTAGE.**
While many companies have deserted the military ASIC business, our commitment hasn’t changed. So if you’re looking for a long term strategic partner, stand at ease. LSI Logic has earned its stripes by successfully completing more military gate array designs than all other ASIC manufacturers combined. Led by a dedicated Military Aerospace group, we’re ready when you are to make those designs a production reality.

At your command are submicron HCMOS ASICs, RISC microprocessors and DSP products which allow system-scale integration second to none. Our commitment continues as we ready the Silicon 1076, a VHDL system development environment capable of taking you from the highest levels of abstraction right through to actual silicon. Our military arsenal already consists of design software which ensures a first-time hit rate, dedicated manufacturing, radiation hardened processes and package development. Whether your program need is for one design or 30, we’ve got the capability to hit your milestone targets.

Next time you’re looking for a technology upgrade, or need fast time-to-market, enlist the world’s leader in military ASICs and RISC microprocessors. LSI Logic.

Call us at 1-800-451-2742, or write LSI Logic, 1551 McCarthy Blvd., MS D102, Milpitas, CA 95035.

We’ll be there. Because we’re always on active duty.
The newest system through space-time.

The AMP Z-Pack Interconnection System is a scalable, high-density board-to-board/cable-to-board system for nanosecond and subnanosecond applications, in 2 mm and .100" grid sizes to accommodate global packaging requirements.

The fastest members use stripline technology, introducing reference planes between pin columns to retain maximum pin counts in a controlled impedance interface.

The design advantages are immediate: Z-Pack .100" stripline connectors accommodate 250 ps edge rates with no sacrifice in signal density: four rows = 40 lines per inch.

High-temp materials for SMT compatibility.
Twin-beam receptacles, 2 mm wipe.
Sequenced mating up to four levels.
2 mm versions accommodate two traces between lands.
Stripline versions isolate pin columns for 50 ohm interface.
Reliable compliant-pin versions available.
Space: 40 lines/inch.  
Time: 250 ps.

2 mm stripline versions (500 ps) require just one pin row for reference, and open pin field versions in both centers handle 1.8 ns rise-times with a 3:1 signal/ground ratio. Standard spacing minimizes board redesign, and system modules stack end-to-end with no loss of signal positions, offering true form/performance scalability in Futurebus-like applications.

For more information on the Z-Pack Interconnection System, call our Product Information Center at 1-800-522-6752. AMP Incorporated, Harrisburg, PA 17105-3608.

For advanced design and manufacturing of complete characterized multilayer backplane systems, contact AMP Packaging Systems, Inc., P.O. Box 9044, Austin, Texas 78766, (512) 244-5100.

THIS IS AMP TODAY.
What a GaAs.

Want some great news about GaAs? Check into HP. As a leader at the forefront of GaAs technology, we've got a full line of high-performance products to choose from.

Consider our GaAs MMIC attenuator, the only device in the world operating from DC-50GHz. Its wide-attenuation range, exceptional bandwidth, and fast switching speed make it ideal for automatic gain control, amplitude, and pulse switching.

Our line of GaAs Schottky diodes is optimized for 26-60GHz. But its low series resistance and low capacitance ensures a high cut-off frequency, giving you solid performance from 5GHz to 100GHz.

If you're looking for the right general-purpose switch, switch to HP. Our new broadband GaAs MMIC SPDT devices offer low insertion loss and high isolation for improved system performance from DC-6GHz.

HP's great GaAs news also includes a family of high-gain, high-power MMIC traveling wave amplifiers. Each is designed to operate from 2-26.5GHz, and 100% RF tested to provide guaranteed spec performance.

No wonder HP sets the standard for quality, reliability, and innovation. If you'd like more information about HP's broad line of high-performance GaAs products and a listing of your nearest HP Components distributors, call 1-800-752-0900, ext. 2396. And see us at MTT-S, Booth #730.

There is a better way.
NEWS BREAKS
EDITED BY SUSAN ROSE

WINDOWS OPENS ON CIRCUIT SIMULATOR, FRAMEWORK CLOSES

Although Microsim’s Schematics uses Windows 3.0 on 80x86-based personal computers, the schematic-capture software isn’t using Windows as a framework that would let you interface to third-party Spice simulators. Instead, Windows compatibility gives you multitasking capability and a familiar look and feel. The schematic-capture tool is coupled only to the vendor’s PSpice simulator and Probe output analyzer/viewer (although both run in Windows, neither PSpice or Probe is a Windows 3.0 application, yet). This coupling lets you run simulations from within the schematic application—the software automatically calls a netlister to generate your Spice input file before the simulation starts. The schematic-capture program includes libraries containing more than 5000 analog and digital parts models. Features such as auto-incrementing of names and labels, auto-step and repeat, an electrical-rule checker, and a symbol editor are also part of the schematics package. The software also runs on Sun workstations as an Openwindows application. Through September, the software costs $1250 for an IBM-PC and $4150 for a SPARCstation. Microsim Corp, Irvine, CA, (800) 245-3022, FAX (714) 455-0554.—Michael C Markowitz

3V CMOS STANDARD-CELL LIBRARY CONSERVES BATTERY POWER

The 3V operation of AT&T Microelectronic’s 0.9-µm CMOS library reduces power, heat, and packaging costs. The library includes basic cells, memory elements, and high-level macros. The memory-cell list includes synchronous and asynchronous static RAM, a register file, a dynamic shift register, and ROM and FIFO memory. The following high-level macros are also available: DMA controller, UART, 8-bit microcontroller, programmable timer, interrupt controller, memory mapper, and real-time clock. A major tradeoff in moving to a lower-voltage library is lower transistor gain, which slows switching speeds. The library includes higher-power cells to use in speed-critical paths. You can develop ASICs with this library using the company’s own Unix-based design tools. By the third quarter of 1991, you’ll also be able to use tools from other major CAD vendors, including Cadence Design Systems (San Jose, CA), Synopsys (Mountain View, CA), Mentor Graphics (Beaverton, OR), and Viewlogic (Marlboro, MA). AT&T Microelectronics, Allentown, PA, (800) 372-2447 ext 804; in Canada, (800) 553-2448 ext 804, FAX (215) 778-4106.—Anne Watson Swager

SEMICONDUCTOR, SINGLE-BOARD COMPUTERS OFFER FLEXIBILITY

Ziatech’s Application-Specific Automation Processor is an option if you can’t find the right off-the-shelf single-board computer (SBC) for your embedded control application. You can select among a list of core modules, peripheral I/O modules, and custom I/O modules for the board, instead of investing the time and money to develop a custom SBC. Because 90% of the board comprises modules from previously tested and proven designs, the risk associated with a new design is minimized. The board is designed around the STD Bus form factor and uses a 16-MHz NEC V53 µP for 80286 performance and code compatibility. You select the RAM, PROM, Flash EPROM, counters, timers, DMA channels, peripheral I/O modules, and other features you’ll need. The initial contract for development and delivery of 25 boards is $45,000. Delivery is 12 weeks, but prototyping cards let you begin software development before you have the first boards. The semicustom product is aimed at users requiring a minimum of 500 SBCs per year. Typical costs are $500 to $800 per board. Ziatech Corp, San Luis Obispo, CA, (805) 541-0488, FAX (805) 541-5088.—Doug Conner
FLAT-TENSION MASK TECHNOLOGY ADVANCES TO 17-IN. CRTS

Zenith Electronics Corp demonstrated 17-in. and 20-in. prototype versions of its flat-tension mask (FTM) CRT at the Society for Information Display Symposium held last month in Anaheim, CA. The 17-in. display was not just larger than the company's existing 15-in. FTM CRT display; the new display adds multifrequency operation and better maximum resolution—1024 x 768 pixels. The 17-in. tube retains the flat screen inherent with FTM technology. Other FTM CRT advantages include the lack of purity loss caused by electron-beam heating of the shadow mask; added ruggedness because the shadow-mask supports are bonded directly to the CRT's faceplate; better luminous efficiency because the shadow mask and screen are more precisely aligned; and greatly diminished glare because of the antireflection coating on the front of the CRT's flat face and the antiglare treatment applied to the screen's inner surface.

The company plans to ship production versions of the 17-in. display to OEM customers in November. Evaluation units will be available by early autumn. The company expects the retail price for multifrequency, 17-in. FTM CRTs to start below $2000. In addition, you can order custom single-frequency versions with resolutions to 1280 x 1024 pixels for workstation applications. The company does not sell the displays directly to end users. Zenith Electronics Corp, Glenview, IL, (708) 391-8181, FAX (708) 391-7253. —Steven H Leibson

COMPUTING HARDWARE SHUNS VON NEUMANN

The CHS2 x 4 from Algotronix is an application-specific computer that operates by configuring hardware to a computational task. An IBM PC or compatible plug-in card houses the computer, and data flows via the IBM PC/AT bus or a rear panel I/O connector. You can program the computer to make dedicated datapaths, or map algorithms directly into the hardware. The technique relies upon the company's CAL1024 32 x 32-cell, CMOS field-programmable gate array (FPGA). Using on-chip static RAM (SRAM), you can program each cell of the FPGA to behave as any function of two boolean variables, or as a D-type latch with a 100-MHz toggle rate. You can program a 32 x 32 array in 70 µsec. Each computer employs nine FPGAs; eight form an array of 64 x 128 cells, and one performs house-keeping tasks. The computer also contains 2M bytes of SRAM for local data storage in pipelined computations. You can connect two of the computers to expand their array 128 x 128 cells, with 4M bytes of SRAM. Software support includes a symbolic editor for design work, an assembler and loader for array programming, and a C library for support functions including dynamic reconfiguration. The £4900 evaluation kit available now includes the IBM PC plug-in card and software. Algotronix Ltd, Edinburgh, UK, (31) 668-1550, FAX (31) 662-4678. —Brian Kerridge

NONVOLATILE STATIC RAM OFFERS 35-NSEC ACCESS

Benchmarq Microelectronics's 32k x 8-bit battery-backed nonvolatile static RAM (SRAM) has a 35-nsec access time. Two versions are available: The bq4011H has a 5% power-supply tolerance and the bq4011HY has a 10% tolerance. Both devices come in 600-mil DIP modules that are socket-compatible with standard SRAM, EPROM, and EEPROM memories. The modules include the SRAM, power monitoring and control circuitry, and a lithium battery. The modules are UL recognized. The devices cost $60.50 (100) for the 35-nsec version; $53.10 for a 45-nsec version. Benchmarq Microelectronics Inc, Carrollton, TX, (214) 407-0011, FAX (214) 407-9845, contact John Landau. —Richard A Quinnell
A new generation of performance.
The new SPARCstation™2 from Sun Microsystems delivers almost twice the CPU performance of previous generations – the highest performance in its class.

The reason for this blazing speed: The highest-performance CMOS SPARC® available. The CY7C601, 32-bit SPARC microprocessor and CY7C157 16K x 16 Cache Storage Units from Cypress Semiconductor. Cypress 0.8 micron CMOS gives the CY7C601 SPARC RISC microprocessor 40 MHz clock rates and a sustained throughput of 29 MIPS.

Next generation compatibility.
Because they’re SPARC chips, they’re completely compatible with over 2100 SPARCware™ products. They offer true scalability into a wide spectrum of applications. And a growth path for future high-performance products.
Get this level of performance, potential, and compatibility for your next-generation products.
The Cypress SPARC.

For the whole story on RISC,
call the Cypress Hotline at 1-800-952-6300.*
Ask for dept. C4M.

The complete SPARC chipset, designed by our ROSS Technology subsidiary, is now available for high-volume applications.

VHDL AND HARDWARE-ACCELERATOR MARRIAGES EASE USE

Coming on the heels of Cadence Design System's entry in the hardware accelerator business with its XLP simulation accelerator (EDN, May 23, 1991), rival accelerator producers Ikos Systems and Zycad have teamed up with Racal-Redac and Synopsys, respectively, to make their hardware tools easier to use.

Ikos Systems will deliver a VHDL hardware accelerator before the end of the year. Since hardware accelerators can only accelerate structural (gate-level) simulations, the hardware will rely on Racal-Redac's Silcsyn logic-synthesis software to generate a structural representation from your behavioral description. Nonsynthesizable parts of your description must run in a software simulator that the company is developing, but hasn't yet announced. The claimed capacity of the $59,500 hardware accelerator exceeds 100,000 lines of synthesizable VHDL source.

Synopsys and Zycad have teamed up to integrate the former's $24,000 VHDL simulation tools—acquired from Zycad last year—with the latter's XP fault and logic accelerators (from $55,000). The tools don't perform any logic synthesis, but partition your behavioral models into the software simulator and structural models into the hardware simulator. Cadence Design Systems, Lowell, MA, (508) 458-1900, FAX (508) 441-1109. Ikos Systems, Sunnyvale, CA, (408) 245-1900, FAX (408) 245-6219. Racal-Redac, Littleton, MA, (508) 692-4900, FAX (508) 692-4725. Synopsys, Mountain View, CA, (415) 962-5000, FAX (415) 965-8637. Zycad, Menlo Park, CA, (415) 688-7451, FAX (415) 688-7550. —Michael C Markowitz

USE YOUR MAC AS A LOW-COST SPECTRUM ANALYZER

The $495 Audio-Frequency Fourier Analyzer from National Instruments can turn your Apple Macintosh II computer into a 2-channel, dual-display signal analyzer. You can use the software for measuring the response of low-frequency filters and networks, or to measure the magnitude and phase of low-frequency transmission signals. The software gives you real-time display of the time, power spectrum, magnitude/phase spectrum, correlation function, impulse response, transfer function, and coherence function of incoming signals. At sample rates reaching 48k samples/sec, the program's accuracy specs indicate 426 lines of resolution with a broadband dynamic range of 93 dB and bandwidth from dc to 20 kHz. Frequency accuracy is 0.01% and frequency resolution approaches 0.013 Hz per line. If your Mac lacks the hardware to perform stand-alone signal analysis, you can buy the software bundled with a runtime version of LabView-2, an NB-DSP2300 board, an NB-A2100 board, and a 3-board RTSI cable for $7495. National Instruments, Austin, TX, (512) 794-0100, FAX (512) 794-8411, contact David Koenig. —J D Mosley

LOW-POWER, 10-BIT ADC SAMPLES AT 40M SAMPLES/SEC

The SPT7814 from Signal Processing Technologies combines a 10-bit ADC with an on-chip track-and-hold circuit, samples at 40M samples/sec, and requires no additional components to operate. At 40 MHz, the device draws 1.3W from its 5V and -5.2V power supplies (a relatively small amount of power for a converter this fast). The device's analog input has an input capacitance of 5 pF, which reduces the drive requirements on front-end circuits. The $109 (100) converter has ECL outputs. A companion device, the $79 (100) SPT7810, has similar features but samples at 20M samples/sec max. Signal Processing Technologies, Colorado Springs, CO, (719) 540-3900, FAX (719) 540-3970. —Steven H Leibson
The conventional attachment of a D-Sub connector requires excessive loose hardware and assembly time.

PEM Connect 'R Ware Standoffs dramatically speed assembly and secure the connector with six fewer parts.

For a true DFA product that is less expensive to install, offers increased reliability and improved quality performance, specify PEM Connect 'R Ware® standoffs.

For a Connect 'R Ware product bulletin, circle the number below or call:

TOOL AUTOMATES GRAPHICAL-USER-INTERFACE DEVELOPMENT

Telesoft's Teleuse 2.0 development tool lets developers create OSF/Motif-based application programs without writing the user-interface code. Users paint the screens needed for the application, and the software tool generates the C-language code that performs the user-interface function. The tool can also output code that is compatible with the Open Software Foundation's user-interface language. Other features include support for OSF/Motif version 1.1, support for the X-Window standard version X11R4, and a porting kit that lets you execute software developed with the tool on any OSF/Motif-based system. The software tool will be available in July for $7500 on SPARC, IBM RISC System/6000, and DECstation systems. Telesoft, San Diego, CA, (619) 467-2700, FAX (619) 452-1334. —Maury Wright

GATE ARRAYS OFFER EMBEDDED CELLS

Fujitsu Microelectronics IC Division's family of digital gate arrays offers embedded functions. The functions include single-, dual-, and triple-port RAM, ROM, a multiplier, customized I/O buffers, mask-programmed PLAs, and microprocessor peripheral functions. Initially, these arrays, like standard cells, require all-layer processing. To reduce subsequent turnaround times, you can specify—and pay—to have wafers held at metal mask. These wafers give you the flexibility to make logic changes after evaluating your design. Fujitsu Microelectronics, San Jose, CA, (408) 922-9000, FAX (408) 432-9044. —Michael C Markowitz

RAMDAC SUPPORTS TRUE-COLOR GRAPHICS

The Bt484 RAMDAC (random-access-memory DAC) from Brooktree Corp offers a variety of high-performance graphics features to designers creating PC graphics cards. The device supports resolutions as great as 1024 x 768 pixels in a variety of color modes with gamma correction for true-color modes. It supports XGA 5:6:5-bit (RGB) color mode, Image Capture 5:5:5-bit color mode, 24-bit true color, and is backward compatible with VGA. The RAMDAC can switch between true-color and VGA modes on a pixel-per-pixel basis, preventing the color limitations of VGA from distorting image colors when displaying multiple image windows.

The device also offers a hardware cursor to speed your graphics board's operation under Windows 3.0. The 32 x 32 x 2-bit cursor eliminates the need for the CPU to write a cursor into video memory; the RAMDAC superimposes its cursor wherever you specify, without disturbing the underlying image. Other device features include separate pixel ports for VGA (8-bit) and true-color (32-bit) data and a built-in shift clock to simplify your Video RAM interface. The device comes in 75- and 85-MHz speed grades and is sampling now. Volume production will begin in October; priced from $29. Brooktree Corp, San Diego, CA, (619) 452-7580, FAX (619) 452-1249. —Richard A Quinnell

1-GATE ICS PUT THE LOGIC YOU WANT WHERE YOU WANT IT

Each member of the TC7SXX family of logic devices from Toshiba places one logic gate in a 5-pin SOT-23MOD package measuring 2.9 x 2.8 x 1.1 mm. The 16-member family includes all of the basic logic functions and their logical complements, an analog switch, and a Schmitt-trigger gate. Example pricing includes the $0.16 TC4S71F OR gate and the $0.20 (25,000) TC7S00F NAND gate. Toshiba America Electronic Components, Irvine, CA, (714) 455-2000, FAX (714) 859-3963. —Steven H Leibson
To put VGA graphics on your motherboard, you need a cost-efficient, highly integrated, powerful solution that uses minimal board space. You need the new CL-GD5320 Enhanced VGA-Compatible Graphics Chip from Cirrus Logic.

Use it to incorporate full 16-bit or 8-bit VGA into low-cost personal computers. You only need two industry standard 256K x 4 DRAMs and as few as five other ICs. Whatever memory speed you select — 80ns, 100ns, or 120ns — you'll get a complete VGA display system with greater performance than systems using a more expensive solution with 64K x 4 DRAMs.

You don’t sacrifice features. You get 16-bit and 8-bit support for the VGA graphics standard, and full, register-level backwards compatibility. For maximum performance, it has an 8/16-bit CPU interface, independent video and DRAM clocks, internal FIFOs, and page mode DRAM access. And it will interface to both analog (PS/2 and multi-sync) and TTL monitors.

You can also pick a ready-to-use solution that’s right for you. Anything from a chip with full BIOS, drivers, utilities, user’s manual, and documentation — to a complete manufacturing kit including everything you need to quickly move into high-volume production.

Make your PC more competitive and save time, space, power, and expense. You still get all the speed, features and flexibility you’re looking for.

This full 16-bit CL-GD5320 lets you implement 16-bit or 8-bit VGA capabilities on your motherboard with as few as 5 other chips and two 256K x 4 DRAMs.

Get on board. Call today for more information on our motherboard VGA solutions.

Call 1-800-952-6300. Ask for dept. LM22.
the world's largest selection
2KHz to 8GHz from $4.95

With over 300 models, from 2-way to 48-way, 0°, 90° and 180°, a variety of pin and connector packages, 50 and 75 ohm, covering 2KHz to 8000MHz, Mini-Circuits offers the world's largest selection of off-the-shelf power splitter/combiners. So why compromise your systems design when you can select the power splitter/combiner that closely matches your specific package and frequency band requirements at lowest cost and with immediate delivery.

And we will handle your "special" needs, such as wider bandwidth, higher isolation, intermixed connectors, etc. courteously with rapid turnaround time.

Of course, all units come with our one-year guarantee. Unprecedented 4.5 sigma unit-to-unit repeatability also guaranteed, meaning units ordered today or next year will provide performance identical to those delivered last year.

When you're picking an embedded processor, it pays to watch your step. Or you may wind up with a design that doesn't meet your performance expectations, and a schedule that keeps slipping. Not so with the new Motorola 68EC0x0 line.

From the 68EC000 that's just two dollars and change, to the 68EC040 that delivers a full 22 MIPS, they're all based on the world's most popular architecture. The 68000.

Which means you get a seamless migration path and reams of reusable code. Because each 'EC0x0 embedded microprocessor is binary compatible with all 68000-based microprocessors, and with every other 'EC0x0 family member.

What's more, they're all engineered to give...
your products virtual immunity from memory wait states. They also deliver superior levels of sustained performance, not "peak" MIPS like with other processors. So you can use DRAM instead of SRAM, and minimize your overall system cost.

As you'd expect from Motorola, high performance, low cost and exceptional technical support are all part of the package. And 'EC0x0 embedded microprocessors are available at the price/performance points you need.

So before you pick your next embedded microprocessor, call 1-800-845-MOTO, and get a free sample from the 68EC0x0 family. It's one step you'll never regret.
Memories, ASICs, and Logic ICs Deliver High-End Performance.

For high-end workstation and PC applications, Oki offers a range of ICs with the powerful performance features your high-level board designs demand.

1-Meg Based VRAMs. Oki’s high-bandwidth video RAMs enable the up-front performance required for high-resolution graphic applications. Features include dual port memory and fast access times.

0.8µm Gate Arrays. Manufactured on our volume 4-Mb line, Oki’s SOGs offer exceptional benefits: high-speed logic and I/O performance, high-density macro-functions, high pin count packages, and more.

Field Memory. There’s no better solution for a frame grabber design than Oki’s high-performing 1-Mb serial memory. Features include an internal self-refresh control circuit, making this device appear fully static to the user.

Speech Synthesis. For high-quality performance you can hear, no one matches Oki’s RealVoice™ speech synthesizers. With on-chip filter and D/A, these chips reduce design time and IC count while increasing system reliability.

16-Bit MCU. Oki’s nX family of fast MCUs combines a three-program instruction pre-fetch queue to lower overall CPU cycle time down to 200 ns. Features include a variety of I/O options plus 16K of 16-bit word ROM and 512 bytes of RAM.

Start packing more performance into your system with Oki ICs. Call 1-800-OKI-6388 for the details.

PERFORMANCE UP FRONT STARTS WITH OKI ON BOARD.
Introducing Zilog's Smart Access Controller...
Z180 intelligence and SCC communications together in one package.

The Z80181™ SAC™ Controller is the Smart Access Controller™ that combines two powerful standards. You get Zilog's industry standard SCC™ controller for datacom connectivity together with the popular Z80 CMOS controller. And all that utility comes with the user-friendly Z80® code CPU compatible software.

The Superintegration™ SAC Controller packs the popular high performance Z80 architecture into a new cell suitable for many datacom and peripheral control applications. You get the SCC single-channel communication cell with two additional UARTS, a 4 × 8-bit counter timer (CTC) and onboard 16-bit I/O. The SAC Controller runs at 10 MHz and drives fast serial communications at 2.5 Mbits/sec. With the reduced 3 cycles per instruction, the SAC Controller gives you Z80® code performance 25% faster. That makes the SAC Controller the highest performance, low power embedded controller around.

The best cost/performance of any embedded controller out there.
Whatever your application — data communications, modems, FAXes, printers, terminals, industrial controls — the SAC Controller combination gives you the best cost/performance ratio. Everything you need for your system is on the chip. The SAC Controller brings you all the advantages of Zilog's Superintegration technology: Off-the-shelf and backed by our solid reputation for quality and reliability.

To find out more about the SAC Controller, or any of Zilog's rapidly growing family of Superintegration products, contact your local Zilog sales office or your authorized distributor today. Zilog, Inc., 210 Hacienda Ave., Campbell, CA 95008, (408) 370-8000.

Right product. Right price. Right away.
Reader responds to Editor’s Note about Apple

In his Editor’s Note to the letter from J Thomas Baylor (EDN, March 14, 1991, pg 26), Jon Titus said that he would have been more impressed if Apple had made a commitment to an open bus. Apple has had the Nubus in their bigger machines since 1987, even before IBM switched to Micro Channel (a proprietary bus).

Apple has always encouraged companies to develop or port engineering and scientific applications to the Mac. I wonder why only a few companies do so. In our company, we use Macs only. We refuse to use MS-DOS-based software. If a semiconductor supplier cannot offer us a way to do development for their chips (PLDs, µPs, and such stuff) on a Mac, we refuse to use their chips.

Guido Körber
Applied Technologies
Berlin, Germany

(Ed Note: Which side of the Wall were you on?)

Group offers outlet for budding experimenters

In Jon Titus’s editorial, “Where are the experimenters?” (EDN, February 4, 1991, pg 29), he laments the small number of engineers who help youngsters discover “a love for the technology and a deep enthusiasm for new possibilities.” Now that President Bush plans to recruit 100,000 volunteer engineers to assist teachers through the new Engineers in Education program, perhaps more engineers will work with youth. The American Radio Relay League, a nonprofit national organization for amateur radio operators assists professionals who want to take amateur radio to school—in particular, through the Shuttle Amateur Radio Experiment where students talk to orbiting astronauts via ham radio.

We also work with the IEEE, which sponsors a program for engineers called Amateur Radio in the Classroom. The professionals we’ve assisted report that students who get their hands on the radios and talk, rather than just listen, do get excited, even with cellular phones around. According to some teachers, the Federal Communications Commission’s new entry-level amateur radio license, which doesn’t require a Morse code test, has sparked the interest of students whose enthusiasm for ham radio was dampened by having to tackle Morse code. Anyone interested in taking amateur radio to school or in getting a license can contact ARRL, Dept EADN, 225 Main St, Newington, CT 06111, phone (203) 666-1541, or FAX (203) 665-7541.

Simulation limitations hamper testing of Aegis

In response to Jon Titus’s editorial “Smart weapons, smart lessons”
When customers ask how I got so many connectors delivered so fast, I tell them I have connections. - Ken Talentino
Multi-National Account Executive

(EDN, March 14, 1991, pg 35), I'm an engineer/manager who has been closely associated with the Aegis and 3-T programs for more than 25 years (15 years as a Navy engineering-duty officer and 10 years as the Aegis prime contractor, RCA/GE). I believe a fair appraisal will show that Aegis testing has exceeded the testing of any prior Navy AAW (antiaircraft warfare) missile system. Testing has been constrained primarily by the Navy's inability to fully simulate realistic battle conditions.

Recognizing the constraint very early, the original prime contractor, Wayne Meyer, fought hard for the necessary annual appropriations to improve the Navy's ability to test Aegis directly at high-threat levels. The Aegis program [director] funded the development and fielding of improvements in electronic countermeasure jamming, chaff, targets, and range-control upgrades.

Meyer also established and funded a full-time "Old Crow" team of critics and adversaries for the early identification of soft spots in the design, as well as optimum tactics and techniques to use against Aegis. The present situation is that the Navy doesn't yet have the testing ability to fully stress the Aegis ships.

Safety considerations also impose constraints on staging a wartime environment against Aegis ships. Nearby populated areas, civilian aircraft, line-of-sight communications, and telemetry prevent a full spectrum of attack scenarios.

Has Aegis been tested under realistic conditions? Yes, to the best of the Navy's ability. Has it been fully stressed? No, it has not, but not because of any contrived plan or bogus conditions.

Robert C Beers, Manager
AAW Development Programs
GE Aerospace
Mooresstown, NJ

First, "number facts," then calculators
In answer to Jon Titus's editorial about teaching math (EDN, April 11, 1991, pg 41), I agree in part, wholeheartedly, but I was also married to an elementary-school teacher for many years. I learned from her a little about teaching math in the lower grades. At that level, a calculator would be an unmitigated disaster. The "number facts" must be learned so that they are second nature.

My wife had a cartoon showing a little boy at the blackboard, pout-
ing, with his arms folded. On the board was a problem like $657 \times 149$. The teachers says, “Because calculator batteries go dead, that's why.”

I was once that little boy.

When I was nine years old or so, a neighbor who was an engineer died. I inherited his slide rule. No one in my house knew how to run it. I used to stare at it by the hour as I slid it back and forth. Once, by accident, I aligned the 1 with a 2, and noticed that at the other 2 was 4, and at the 3 was 6. I was hooked. I had a machine to do arithmetic. I refused to learn to multiply. Only after threats and promises would I learn my tables.

Log-log slide rule or scientific calculator, the device is essential to free the mind to explore math. Once children have learned the basics of arithmetic, their minds should be allowed to soar by using calculators to take the drudgery out of it.

**Milli—not mega**

In the Test & Measurement Instruments section of New Products (EDN, April 11, 1991, pg 176), EDN ran an item about the SR760 FFT spectrum analyzer from Stanford Research Systems. We erroneously described the $4350 instrument as covering a much wider frequency range than FFT analyzers cover. The product works with signals from 191 milliHertz (not MHz) to 100 kHz. Stanford Research Systems Inc is located at 1290D Reamwood Ave, Sunnyvale, CA 94089. Phone (408) 744-8040. FAX (408) 744-9049. TLX 706891.
Before the A500 started testing Motorola's mixed-

testing?

the Teradyne A500 test system supports our Six Sigma initiative and our competitive leadership challenge.”

Director of Marketing

Motorola knows you can't have a Six Sigma process unless you can test to Six Sigma standards. That's why Motorola’s MOS Digital-Analog Integrated Circuits Division chose the Teradyne A500 Analog VLSI Test System. Because, in addition to proving the A500 could handle the complex technical requirements of Motorola’s advanced ISDN interfaces, we also demonstrated that we could perform to Motorola’s stringent quality levels.

“Can it do scan testing? Digitize high-frequency waveforms? Do true mixed-mode testing? Does it have a flexible architecture? Can you give us the support for a Six Sigma process? Applications expertise? Complete documentation? The right tools? In each case, Teradyne answered yes.”

Manager, Advanced Test Technology

“Motorola has adopted a Six Sigma initiative which focuses attention on approaching zero-defect performance in everything we do, including our test systems. Our purchase of

Motorola and @ are registered trademarks of Motorola, Inc.

EDN June 20, 1991
signal technology, Teradyne had to pass a few tests.

With the A500, Motorola had the ability to digitize waveforms at 20 MHz, plus the high pin count necessary to guarantee that their ISDN U-Interface worked the way it was supposed to.

Best of all, the A500’s full tester simulation and powerful IMAGE™ software provided the design flexibility and rapid debugging Motorola needed to deliver defect-free parts on time.

“The A500 gave us the resources we needed, in one place, to be able to have a functioning test program very quickly – at least two to three times faster than any other test system. This type of support is just what we need to get our complex circuits, such as the U-Interface transceiver, to the marketplace ahead of the competition.”

Operations Manager

To Motorola, delivering Six Sigma quality is not just a promise. It’s a way of doing business. And it’s a test that must be passed by suppliers as well.

To see how our A500 family of test systems can help you deliver quality, call Beth Sulak at (617) 482-2700, ext. 2746.

Or call your nearest Teradyne sales office, or write: Teradyne, Inc., 321 Harrison Ave., Boston, MA 02118.

F132-2 REV. ORIG.
Since other 12-bit ADCs need four times the space to go half as fast at twice the price, we use the term "competition" lightly.

Maybe we are being a little boastful when we say that compared to the AD671, every other 12-bit monolithic A/D converter is a lightweight. But see if you don't agree.

The AD671 comes in a 24-pin skinny DIP package. (Other A/D converters are in double- and triple-wide DIPs, taking up to four times as much space on your board.)

The AD671 has a true conversion time of 500 ns. (Making it twice as fast as the nearest "competitor").

The AD671 costs only $65. (You can expect to pay at least double that amount for any other "comparable" ADC.)

And the AD671 doesn't have calibration cycles, complicated interfaces, or specs that can't hold up over temperature and power supply variations. (But if you like these things, you can get them with other ADCs.)

To find out more about the A/D converter that has more weight behind it, get a data sheet on the AD671 by contacting Analog Devices at 1-800-262-5643. Or write to Analog Devices, P.O. Box 9106, Norwood, MA 02062-9106.
Source of alternate sources

More than half the letters Ask EDN receives are from engineers looking for alternate sources or sources of obsolete parts. The 1991 DATA Digest Alternate Sources and Replacements Library contains alternate-source information for more than 688,000 devices, including ICs and discrete semiconductor devices. The library also includes more than 173,000 discrete-semiconductor suggested replacements. Parts from more than 500 manufacturers are represented. The 3-volume set costs $295.

DATA Business Publishing
Box 6510
Englewood, CA 80155.

Also, the following company has picked up some obsolete RCA consumer parts:
Thomson Consumer Electronics
200 Clements Bridge Rd
Deptford, NJ 08096.

Few high-temperature-component sources found

We are looking for components to operate at 200 and 250°C: op amps, voltage regulators, transistors (similar to 2N2907 and 2N2222), diodes, resistors, capacitors, transient suppressors, miniature EMI filters, and analog ASICs or hybrid microcircuits.

Donald Weinstein
Kulite Semiconductor Products Inc
Leonia, NJ

We first turned to National Semiconductor's Bob Pease with this question. He says that he is not aware of any parts specified at these temperatures, but says the LM12 150W op amp will work at temperatures as high as 250°C.

Contacts at Harris Semiconductor (Melbourne, FL) say the company used to have a line of components specified for high-temperature operations but discontinued the line when the oil industry in the United States fell apart. Harris still has some products, including op amps, that operate at 200 and 250°C, but there are no guarantees.

Several companies, including Silicon General (Garden Grove, CA), are working on a radiation-hardened process that produces parts that can operate at 300°C. The technology is called silicon on insulator, or SOI. In six months to a year, Silicon General plans to introduce a 5V power regulator and a PWM control chip made using SOI processes. If any readers can shed more light on the SOI process, Ask EDN would like to hear from you.

We were much more successful finding sources of high-temperature resistors and capacitors. Caddock Electronics makes high-precision, high-voltage, and metal-film resistors that operate at temperatures as high as 275°C. Dale Electronics makes high-voltage, metal-film, metal-oxide, and wire-wound resistors that operate at both 200 and 250°C. Component Research Co Inc makes teflon-film capacitors that operate at 200°C.

Reader seeks gold replacement

I have an application that uses an elastomeric (zebra) strip connector from an LCD to a pc board, which we gold-plate to ensure a quality connection from the connector to the board.

I am currently investigating alternatives to gold plating for this application. I am looking into the use of lubricants, fluids, or other chemicals in conjunction with an elastomeric connector to provide the same quality connection between the elastomeric strip and the pc board that gold provides.

Any information, pro or con, about the method we currently use, methods involving lubricants, or any other successful zebra-to-pc-board mating methods would be useful to my investigation.

Marty Gappa
Watlow Controls
Winona, MN

Executive Editor Steve Leibson, whose Technology Update on contact-enhancing chemicals appeared in the March 14, 1991, issue of EDN, recommends that you contact D W Electrochemicals. The company's Stabilant 22 product is a concentrated liquid polymer that fills gaps between mated contacts and conducts current under an applied electric field. The product will probably do just the job you need, but you should ask the company about your specific application. Stabilant 22 could possibly work even better than gold plating because it fills in the gaps between the connector contacts and isolates the joint from the atmosphere.

D W Electrochemicals Ltd
9005 Leslie St, Unit 106
Richmond Hill,
ON, L4B 1G7 Canada
(416) 889-1522

Ask EDN solves nagging design problems and answers difficult questions. Address your letters to Ask EDN, 275 Washington St, Newton, MA 02158. FAX (617) 558-4470; MCI: EDNBBS. Or send us a letter on EDN's bulletin-board system at (617) 558-4241; leave a letter in the ask...edn Special Interest Group.
High performance blowers provide variable air flow from 120 VAC input

These new Windjammer* blowers combine electronics, motor, and fan system in a compact, cost-effective package. An exclusive Lamb Electric design, they were developed for demanding, limited space applications such as business machines, medical equipment and materials handling applications.

Just 5.7" in diameter, the blowers have 1-, 2-, or 3-stage fans for performance from 75" H₂O vacuum at 0 CFM to 125 CFM at 0" H₂O. With one version, a 0 to 10 VDC signal from a sensor or other device will control motor speed and adjust air performance from 0 to 100%. Or, a second model provides manual speed control by means of a potentiometer located in the blower housing.

These blowers also feature low noise performance and are UL/CSA component recognized. AMETEK, Lamb Electric Division, 627 Lake Street, Kent, OH 44240. Tel: 216-673-3451. Fax: 216-673-8994. In Europe, Friedrichstrasse 24, 6200 Wiesbaden, Germany. Tel: 611-370031. Fax: 611-370033.

Compact units feature brushless dc motors with integral controller and variable speed capability.

WE DO 68,000 IMPERSONATIONS.
AND THEN SOME.

ZAXPAK in-circuit emulators can impersonate most microprocessors, including the Motorola 68000. So now you can debug and integrate your design faster and more efficiently. We're the leader in 16-bit emulation, including 68000, 80C186 and V50. We also support 8 and 32-bit chips and specials like Mitsubishi's MELPS 7700.

ZAX has been delivering design tools for over a decade. Now we've put that experience into our new ZAXPAK family of hardware/software solutions featuring source-level debug and one million breakpoints. All under control of your terminal, PC, workstation or Ethernet. Or use our optional built-in host platform.

So call us today at 1-800-421-0982. (In CA call 1-800-233-9817). And see how doing a few quick impersonations can help you bring your design to market faster.

ZAX
2572 White Road, Irvine, CA 92744.
Put your design to the test.

While our price indicates good value, it's our service which makes that value great. Our VME boards, real-time operating systems and software development environments are backed by superior technical support before and after the sale. The Heurikon V3D is the first in a series of new 680X0 value priced entrees. If you're hungry for more information, give us a call.

1-800-356-9602. Bon Appétit.
When you're looking for a sure they provide these

Few suppliers can match our record. We're the leading worldwide supplier of data converters, and the top analog supplier to the military/aerospace and instrumentation markets. Plus we're a growing force in the high-volume arena, providing three of the top five Japanese consumer electronics firms, and seven of the top 10 hard disk drive manufacturers with high-performance components.

Your supplier should offer applications support around the world. Analog Devices has offices in 34 countries, as well as worldwide manufacturing and stocking facilities.

Does your supplier have 25 years of signal processing expertise? Analog Devices does, and you can tap into it by simply picking up the phone. And with our recent acquisition of PMI—a leader in precision op amps and Class S mil/aerospace applications—you have even more experience to call upon.

With Analog Devices, you get direct access to the most knowledgeable applications engineers in real-world signal processing.

You get the design tools—macromodels, evaluation boards, on-line support, technical seminars and application notes, among other things—necessary to get your products up and running quickly.

And you get 25 years of design expertise—expertise evidenced by the most complete line of high-performance linear, DSP and mixed-signal components. ICs made possible by one of the broadest manufacturing process portfolios,
A good supplier works to save you time and money. One way we do it is by providing state-of-the-art macromodel design tools that let you quickly and easily simulate the performance of many of our op amps. We also offer you evaluation boards for our data converters, and complete design kits for our DSP processors.

Do you get the service of a small company backed by the resources of a large one? If your supplier is Analog Devices, you do. Analog and digital experts work together to solve your problems. And top management takes a hands-on approach to customer support.

which includes leading edge BiCMOS, Flash, Complementary Bipolar and many others.

As a $540 million operation, we have the resources that help you achieve top performance from our ICs. Performance that translates into higher levels of system integration, greater reliability and a better end product.

Whatever high-performance part you're looking for, we are the one company that can deliver it.

Call us at 1-800-262-5643 for a free copy of our recent booklet on Mixed-Signal Technology.
Motorola's In Real

© 1990 Motorola, Inc. Motorola Computer Group is a member of Motorola's General Systems Sector. VMExec is a trademark of Motorola, Inc. All other product or brand names mentioned are trademarks or registered trademarks of their respective holders.
One glance at the full array of options Motorola offers in real-time, and you’ll see why it’s become the developer’s platform of choice. For both target and host environments, no other single vendor has anything like it.

One reason is our long-time experience with real-time technology, beginning with our pioneering work back in 1980. Another is the broad spectrum of our product line, which includes ICs, boards, systems, and software. In short, Motorola has everything you need to build real-time applications ranging from simulation to industrial automation to imaging and more.

Yet another reason to choose Motorola is our unending commitment to open standards. Our real-time platform gives you standards-based choices at various levels of integration. The centerpiece of this non-proprietary approach is VMExec, our wide-open, totally integrated development environment. VMExec allows you to use standard UNIX interfaces to write a single set of application code, and then reuse it for other projects. Better still, you can combine any software product that conforms to these standards. VMExec includes a high-performance real-time executive, a strong run-time connection to UNIX-based systems, flexible and efficient real-time I/O and file systems, as well as powerful development and debug capabilities. And because VMExec is integrated with the hardware, you can begin software development even before the hardware is available.

If you’re thinking about real-time, you should be thinking about time to market, and that’s all the more reason to think Motorola. Especially when you consider that we can help speed product integration by serving as a single source for boards, software and systems. Add to that the industry’s best applications expertise and design support, ranging from small embedded control systems to multi-processor simulation. Then factor in Six Sigma quality control. And remember that Motorola gives you the industry’s only true migration path from CISC to RISC in both the development and run-time environments.

Give us a call today at 1-800-624-8999, ext. 230, and put the real-time resources of Motorola on your side. We think you’ll find the benefits are very big, and very real.

**We Do Real-Time Full-Time.**

At Motorola, we’ve dedicated an entire division solely to real-time development systems. Our real-time system architecture begins at the microprocessor level in either CISC or RISC, and extends all the way to the end-user. Today, you can use VMExec to port UNIX applications to an SVID-compliant (and soon, POSIX-compliant) real-time environment, and vice versa. And they can be used for run-time capabilities as well as for development. Several human interfaces are available for UNIX, including Motif, X11 and DeltaWINDOWS. As for networking, Motorola supports all popular protocols, including TCP/IP, NFS, SNA, OSI, and X.400. We also offer database and CASE tools, and you can work in C, LISP, FORTRAN, ADA, BASIC, COBOL, and PASCAL. Put it all together, and you will discover only one company gives you the full story on real-time, and that’s Motorola.
We were made for each other.

Fast, versatile microcontroller.

Running at speeds up to 30 MHz, National Semiconductor's family of HPC microcontrollers really fly. But without a top-notch emulator to keep up with them, they were essentially flying solo.

Enter HP. We got together with National and developed an emulator that perfectly complements these exceptional microcontrollers. Microcontrollers that offer the most numerous, optimized applications for industrial control, communication, computer peripherals and automotive systems.

Our HP 64775 emulators have a proven architecture that's cost-effective and easy-to-use. They provide full-speed emulation, as well as real-time, symbolic analysis support.

You may not need a further incentive to buy, but we'll give you one anyway. For a limited time, you can get $3,000 off the $18,000 price. Call the HP Microprocessor Development Hotline at 1-800-447-3282, Ext. 101 for a free demo disk, as well as product information and a list of distributors near you.

You'll see why we found the National microcontrollers very well worth emulating.

© 1991 Hewlett-Packard Company CS0001
The devil, you say?

This is the time of year when companies rush to put the finishing touches on CAE software and systems so that they can announce and show the products at the annual Design Automation Conference. Before you get swept away by all the new-product announcements, consider the fate of Fred.

Fred was a CAE software vendor for six years before the stress of staying ahead of his competitors took its toll. Fred had a stroke and passed away. Since Fred was mostly fair, honest, and responsible during his stay among the mortals, he went to Heaven. Saint Peter met him at the Pearly Gates and welcomed him with open arms. The angel gave Fred a tour and introduced him around. Being a smart businessman who makes decisions only after carefully evaluating all his options, Fred wasn't so sure that Heaven was all it was promoted to be.

"I'm sure Heaven is terrific," Fred said. "But before I agree to stay I have to check out the alternatives."

"You're wise to consider your options," Saint Peter replied. "I warn you, though, once you tell me your choice, you cannot change your mind."

Fred agreed, and the angel put him on the elevator to Hell. After a few minutes, the elevator slowed and then stopped. The door opened. There, waiting to greet Fred, was Satan dressed in a natty tuxedo and fluorescent green sunglasses. All around people were frolicking and making merry. The sounds of happiness and merriment were consuming. Fred was awe struck. "This is the place for me," he exclaimed. "I've got to go back and tell Saint Peter I'm staying here. I'll be right back."

Fred pushed the elevator's Heaven button. When he got there and told Saint Peter his choice, the angel was disappointed and reminded Fred of the finality of his decision. But Fred was confident he'd made the right choice. He said goodbye, got in the elevator, and pushed the button for Hell. As the elevator descended, Fred felt warmer and warmer. Soon Fred was so warm that he had to remove his shirt and tie. As the sweat dripped from his body, the elevator door opened. Satan, now dressed in flaming red, stood before him, pointed his trident, and ordered Fred from the car. Spine-chilling screams filled the air. Fred was frightened, but found the courage to ask what happened to all the happy people he'd seen just a few minutes ago.

"Ah," replied Satan, "That was just the demo."
They also cut your product costs, with prices low enough to impact your bottom line.

As for logic delays, we've cut them down to a remarkably low 12ns.

So now you can cut something from your design: PALs and GAL's. Because our Classic parts give you a combination of speed, density and flexibility you won't find in other PLDs.

All of which helps you cut the time it takes to produce a superior design.

For example, our 20-pin, 8-macrocell EP330 is the perfect replacement for over 20 types of PALs and GALs. It stretches counter frequencies to 125 MHz while sipping one-fourth the power of a standard PAL. And its quiet output switching circuitry allows the EP330 to run faster in-system than a 10ns 16V8.

Our 24-pin, 16-macrocell EP610 delivers 60% more logic density than a 22V10. And unlike a 22V10, the 15ns EP610 consumes a mere 20µA in standby. And its registers
can be programmed for D-, T-, JK- or SR-operation or for asynchronous clocks.

To replace multiple PALs and GALs with a single chip, try our 44-pin EP910 or 68-pin EP1810. Both offer superior logic density and greater I/O at a lower cost than any other mid-range CMOS PLD.

Our Classic EPLD family also helps you get to market faster. Thanks to a host of powerful logic development tools from Altera and third parties.

What's more, we offer the industry's broadest, most flexible line of CMOS PLDs. With devices ranging from 20 to 100 pins, and logic densities from 8 to 192 macrocells, there's an EPLD for every logic design task.

So call Altera today at (408) 984-2800 for more information. And discover programmable logic that's a cut above the rest.
The IBM RISC System/
The power you’ve been seeking

It's a never-ending quest for power seekers. You're always looking for ways to run your favorite applications faster. Well, search no more. The RISC System/6000™ family of POWERstations and POWERservers gives you power that soars as high as 23 MFLOPS.

When it comes to porting, your ship has come in. Of course, all the speed in the world wouldn't mean much without the applications you need. So the RISC System/6000 family already has more than 2,500 of the most popular technical and commercial applications up, running and running fast. And if you think you know a good thing when you see it, so do software vendors. That's why you'll also be seeing more and more applications coming on board the RISC System/6000 platform all the time. And if you like to build your own solutions, there's a full arsenal of enablers and relational data bases from leading vendors, as well as CASE tools and a host of popular programming languages.

A smorgasbord of solutions. Applications already announced include the IBM engineering design packages CADAM, CAEDS, CBDS,

MFLOPS are the results of the double-precision, all FORTRAN Linpack test 100x100 array suite. The Dhrystone Version 1 test results are used to compute RISC System/6000 Integer MIPS value where 1,757 Dhrystones/second is 1 MIPS (Vax 11/780). SPECmark is a geometric mean of ten benchmark tests. All performance data are based on published benchmark information.

IBM is a registered trademark, and RISC System/6000 and CADDS are trademarks of International Business Machines Corporation. SPECmark is a trademark of Standard Performance Evaluation Corporation. UNIX is a registered trademark of UNIX System Laboratories, Inc. CADAM is a trademark of CADAM INC. DBMS is a trademark of Digital Equipment Corporation. CATIA™ and AES. Also available are a broad spectrum of solutions from vendors like Valid Logic, MacNeal Schwendler, Swanson Analysis, SAS Institute, SPSS, Wavefront, Alias, Polygen, Cadence, Fluid Dynamics International, Western Atlas, ECL Petro and creareX. Scientific and technical applications are available in areas like physics, structural analysis, chemistry, securities trading, mathematics, earth resources, operations research, visualization, graphics, technical publishing and more. There's also accounting software like FourGen and support for leading UNIX®-based office automation packages. And there are key industry applications for businesses in medical groups, retail stores, newspapers, pharmacies and many more.

Command enormous processing clout. The RISC System/6000 family is built to boost the performance of the software power seekers use most. It's got the best floating point processor in the business for numerically intensive applications, plus a new superscalar processor and incredible 3D graphics capabilities. To find out more, call your IBM marketing representative or IBM Business Partner. For literature, call 1 800 IBM-6676, ext. 990.

For the Power Seeker.
How Many Times Do You Build Your Product?

Now EEs0f Has the Answer to Faster Time-to-Market for Microwave and RF Product Design...

THE SOLUTION? EEs0f SOFTWARE!

With today's emphasis on commercial applications, faster time-to-market is critical to insure profit. But the cut 'n try design of microwave and RF circuits can wipe out those profits before manufacturing begins. And component tolerance and aging, process variation, and temperature effects can kill a product after it's gone to manufacturing. Not much to keep the boss happy.

EEsof's Design-for-Manufacturing software brings advanced CAE/CAD technology to high-frequency analog engineers and lets you optimize designs under realistic manufacturing conditions. Even difficult nonlinear designs—amplifiers, mixers, and oscillators—become straightforward. EEsof's system and circuit simulation programs, including Touchstone®, OmniSys®, jOMEGA™, and Libra®, let you simulate and optimize manufacturing yield while accounting for component statistical variations.

Send today for your free copy of EEsof's "Solutions in Design for Manufacturing," and let us show you how to eliminate prototype rework and get your product through manufacturing faster. Call us at (800) 624-8999, ext. 155. Or if you prefer, contact us by FAX at (818) 889-4159. In Europe, call (49) 8105-24005 or FAX (49) 8105-24000.

Breaking the Barriers...
TECHNOLOGY UPDATE

LOW-BIAS-CURRENT OP AMPS

Femtoamperes fuel multifarious functions

It doesn’t take much to believe that amperes are flowing when you feel a component's warmth, or witness an occasional spark. But transport your mind to the femtoampere ($10^{-15}$ A) level, and it takes a lot more effort to imagine anything useful trickling along the wires.

Nonetheless, current at this level is lifeblood to the input of electrometer-grade op amps. Electrometer-grade loosely describes that narrow class of op amps with input bias-currents ($I_B$) in the subpicoampere region. A narrow class it may be, but without these op amps, amplifiers capable of sensing teraohm source-resistance transducers, integrators with a 24-hour time-constant, sample-and-hold amplifiers with 100 µV/sec drop, and log amplifiers with 180-dB dynamic range, would be harder, if not impossible, to produce.

Translate these circuits into products such as gas detectors, hydrophones, glucometers (blood sugar measurement), and CAT scanners. Add to the list electrometer DMMs, pH meters, photodiode amplifiers, nuclear particle detectors, even airport luggage scanners, and you appreciate our dependence upon this special class of op amp.

As is often the case, the design of an op amp’s input stage determines its key characteristics. In general, for optimum low-level performance, a bipolar-transistor input stage is the best compromise. But where importance of $I_B$ is paramount, junction FETs (JFETs) or MOSFETs are the op amp designer’s automatic choice for input component. Compared with a bipolar transistor, an FET’s higher-input offset voltage ($V_{th}$), $V_{th}$ TC, and doubling of $I_S$ for every 10°C temperature rise is part of the penalty of focusing solely on $I_B$.

Even so, FET gate input-current depends upon the geometry and the fabrication process, and designers must still make adjustments to reach subpicoampere levels. Many common CMOS input-stage op amps have picoampere $I_B$ at room temperature and below. But over an operating temperature range as high as 70°C ambient, $I_B$ enters the low nanoampere region, rendering the op amp useless for sensing even 1-GΩ source resistance sensors. Table 1 shows the few op amps with $I_B$ no higher than 100 pA at 85°C. Compare prices...
Low-bias-current op amps

carefully, because figures assume lower-cost plastic packages where available. Some vendors insist upon metal packages, claiming that they offer screening advantages and more consistent performance in the long run.

While \( I_B \) is the principal concern for the range of applications mentioned, as always, other parameters play a secondary role. Table 1 also shows input offset voltage \( V_{\text{io}} \), \( V_{\text{io}} \) TC, and open-loop gain.

Choose FETs, FETs, or FETs

Both MOSFET and JFET input stages achieve low-level input current, but there are trade-offs with parameters other than \( I_B \). MOSFETs can have the lowest input current, but generally show worse input voltage characteristics. MOSFETs are also more susceptible to transient damage without good protection, but protection components induce more input leakage. Better process control with JFETs gives a significant edge to \( V_{\text{io}} \) and its associated TC and noise figure. But this outcome doesn't mean all vendors automatically offer JFET inputs. A glance at Table 1 shows that approximately half of the vendors stick with MOSFETs. If you look further, you'll see as much as 10:1 difference in \( V_{\text{io}} \) between JFET and MOSFET types. But note this ratio also tracks into the price column.

Whatever the choice of input FET type, op amp designers follow certain basic design principles. First, the smaller the dimensions of the FET, the lower the gate current. However, by indiscriminately reducing FET geometry, you eventually lose control of the voltage-match characteristics of the input pair, giving rise to high \( V_{\text{io}} \) and poor voltage noise performance. Clearly, a balance between voltage and current objectives achieves optimal results.

In this fine balancing, no amount of fiddling with geometry and process alters the significant TC of an FET's gate current. Gate current approximately doubles for every 10°C rise in ambient. The only way to ensure an acceptable input current at 85°C is to design for a low femtoampere figure at room temperature.

Second, to maintain low-gate current across the operating range of variable input and power supply voltages, a cascode (or bootstrapped), input-stage circuit is mandatory. Effectively, this means internal power rails to the input stage float and track with the op amp's input signal. The result is a minute change in input characteristics with varying input signal or external power supply, yielding common-

mode input-impedance figures of approximately 1000 teraohms \((10^{12})\), in parallel with less than 1 pF.

Common IC fabrication processes, called junction isolated, result by default in a reverse-bias diode that appears between individual components and the IC substrate. For normal ICs, this large parasitic diode junction causes no ill effect. For low \(I_B\) op amps however, the reverse leakage through the diode is significant.

Burr-Brown uses a dielectric isolation step in the fabrication process of its JFET input op amps, which eliminates the diode. According to Bruce Trump, Burr-Brown's op-amp product specialist, all of the company's low \(I_B\) op amps have dielectric isolation. Eliminating the diode-leakage element from the op amp's input current lets larger FET geometry yield voltage-characteristic improvements.

Analog Devices uses a conventional junction-isolation process, but deals with leakage in the parasitic diode by using a pair of JFETs, each with two electrically isolated gates: The top gate handles the input from the outside world, while the back gate receives its drive from an internal bias network. The input current to the back gate contains the leakage-current element of the parasitic diode, leaving the top gate with only its own input current. According to Jay Cormier, Product Marketing Manager with Analog Devices, the potential of the input FET's top and back gate track to within 30 mV over the operating supply voltage and temperature range. A second geometrically matched pair of dual-gate FETs model the operating point of the input FETs and develop a drive to bias the input-stage back gates. A further drop in \(I_B\) results from a top-gate junction area reduction to around 2000 \(\mu\m^2\), in comparison with the back-gate area of more than 30,000 \(\mu\m^2\).

### Varactors win the day

While admiring process antics that achieve these unbelievably low currents, don't overlook what a bit of slightly older technology can do. Teledyne's 1702 module op amp includes an example of a varactor-bridge-input stage for the ultimate in low \(I_B\)—5 fA at 25°C, with a TC of 2 fA/°C. This \(I_B\) effectively results from the leakage current of two reverse-bias diodes—the input varactor pair. The varactors form two arms of an ac capacitance bridge running at approximately 100 kHz. The input signal to the op amp causes a change in capacitance of one varactor diode, which unbalances the bridge. The conse-

**This PIN photodiode amplifier is one application for Burr-Brown's 75-fA \(I_B\) and 500-µV \(V_{TH}\) OPA128. Using an HP 5082-4204 photodiode sensor and a feedback resistor of 10 GΩ, the circuit's \(V_{OUT}\) is 3V/mW.**
Low-bias-current op amps

quent change in ac level from the bridge drives an ac amplifier, followed by a demodulator and dc amplifier to produce the op amp's output signal. Compared with monolithic op amps, the module's design is complex and the gain-bandwidth product is only 350 Hz. But with a key specification an order of magnitude up on its nearest rival, there is plenty of life in this product, even at $309.

According to Jim Fleming, Teledyne's Applications Manager, the product appeals mainly to medical researchers, hospitals, and medical instrumentation manufacturers. There is also a growing military interest with infra-red search-and-track system integrators for use in test and calibration of circuits using monolithic, low-Io op amps. Fleming points out that varactor inputs are particularly resistant to input overload abuse. The 1702 withstands inputs of ±200V common-mode max, and 100V differential-mode typ.

By far the greatest problem designing with low-Io op amps is ensuring that the op amp's input femtoamperes flow from the signal sensor and not from undefined sources elsewhere in the circuit. Without some very basic precautions, materials that you accept as insulators in normal circuits appear "leaky" to sensor- and op-amp-input impedances in the terahm range. For example, a 15V power rail leaking through a 100-GΩ insulator results in 150 fA; you can see how easily stray leakage can swamp input bias current. By the same token, bear in mind settling time requirements, when just 1 pF with the same 100 GΩ results in a 0.1-sec time constant.

Keithley Instruments Inc publishes a booklet (Ref 1) that, although out of date in a few areas, still contains a wealth of useful information on principles and techniques in making low level measurements. Bob Erdman, Director of New Business Development at Keithley and a veteran designer of femtoampere-level circuitry, offers advice to novice engineers: In the low current world, you must adopt a mode of thinking whereby you look at everything as a current source and forget that there is any such thing as an insulator. You must model every material item in your design as a resistor, capacitor, and current source in parallel. This includes your pc-board, sockets, and standoffs. Using an electrometer, you can characterize all these components.

You must conduct measurements with your circuit under a good grounded shield at all times. A good shield means a light-tight box (many components, such as diodes, are photo-sensitive). If you have a 1/8-in. hole in the shield to bring out wires, then waving your arms around will cause the circuit to respond. You must clamp and shield the lead out.

Regarding pc-board material, Erdman considers normal glass epoxy adequate for currents in the 1- to 10-pA range. Below that figure, Teflon clover-leaf standoffs are good down to 10 fA. If you need to deal with even lower currents, say 10 attoamperes (10⁻¹⁷ A), then you must consider sapphire standoffs.

Of all the problems, Erdman emphasizes effects that result from stress to materials. Teflon, in particular, generates current when stressed. For example, if you build a taught connection to a Teflon standoff into your circuit, don't be surprised if it generates 100 fA.

Low impedance diverts strays

The technique of guarding overcomes the main problem of channeling current from sensor to op amp, while deflecting all other sources of current. The method requires a low-impedance voltage source that faithfully tracks the magnitude of...
Smash the Cache Barrier

IDT's 64K BiCEMOS™ TTL I/O Static RAMs are the ideal solution for high-density cache systems, and are the perfect match for optimizing the high-performance needs of RISC and CISC processors. These 8ns and 10ns SRAMs provide the highest system speed without sacrificing system chip count or increasing power consumption.

Smash the barrier to efficient cache operation at the highest clock speeds. Call today and ask for Kit Code 8041 for free samples of our new 16K x 4 and 8K x 8 TTL SRAMs.

COUNT ON IDT

35 MIPS RISC COMPONENTS AND MODULES

R3000A, the most MIPS at any MHz. The R3051 integrates CPU, cache, and buffers on one chip. RISC modules, eval. boards, and software complement our family of mips™-based RISC products. Your RISC solution is a phone call away!

HIGHEST-PERFORMANCE MEMORIES

Fast FIFOs, dense dual-ports, BiCEMOS ECL, and modules for every system. Over 120 of the fastest FIFOs and multi-port memories. 5ns ECL SRAMs, as well as standard and custom memory modules. Get the specs in the Specialized Memories Data Book.

4ns LOGIC: WORLD-CLASS SPEED

The industry leader. FCT-AT and FCT-CT CEMOS families achieve the fastest speeds with 40% less noise. Everything you need for high-performance designs can be found in the Logic Data Book.

12ns 256K SRAMS

Fastest cache solutions for RISC and CISC processors. More than 36 ultra-high-speed sub-micron SRAMs for 33MHz processing and beyond. Read all about them in the SRAM Data Book.

Call today for your new IDT data books with complete technical specifications and application information.

Low-bias-current op amps

the input-signal voltage. This voltage source drives a conducting barrier that physically surrounds the input signal at all points along its path. The barrier may consist of tracks on a pc-board around the op amp’s input pins, one of the screens of a coaxial or triaxial cable, or a metal enclosure. On the basis that with zero voltage between signal and guard, zero current flows into or out of the signal path. The guard barrier, being low impedance, also readily absorbs extraneous currents.

As well as reducing current-leakage effects, the guard minimizes the influence of stray capacitance on the signal path. Effectively, the low-impedance guard source, instead of the signal source, charges and discharges stray capacitances. A dramatic improvement in settling time arises, roughly in proportion to the ratio of signal source to guard source impedance.

Other hazards exist that also confuse the femtoamperes in the op amp’s input, which even perfect guarding cannot eliminate. These effects derive mainly from mechanical and electrochemical phenomena. Fig 1 shows a comparison of some of these phenomena and their magnitudes.

Movement of the sensor, measuring circuit, or the operator all cause minute changes in capacitance, which result in transient currents. Consequently, you must rigidly fix all parts of the measuring circuit.

Rigid cable for connecting sensors to circuits is not an appealing option. And, if you had thought about drawing a length of regular wire from that dusty reel in the corner of the lab, forget that too. Wire, insulated by low-cost plastic or polyvinyl chloride, is far too leaky for this application. PTFE (polytetrafluoroethylene)-insulated coaxial cable is preferable, but it should be an internally graphite-lubricated variety. The graphite lubrication in the outer braid reduces generation of charge as the cable flexes—a triboelectric effect.

Now having firmly bolted everything down, the next obstacle arises from microphones hidden in the measuring circuit. Vibration and shock to the insulation materials you have carefully chosen to protect the op amp’s input current now produce error currents—a piezoelectric effect. Even favored Teflon insulators, ideal for lifting signals off the pc-board surface, become microphones at the femtoampere level. The only answer is to eliminate the origin of vibration.

You need to exercise equal care in the selection and handling of pc-boards used for the measurement circuitry. Even if you decide upon PTFE material as an improvement over conventional glass-epoxy, cleanliness of the board is a critical factor. Remnants of manufacturing chemicals not only open a leakage path, but also develop tiny voltaic cells sufficient to drive up to 100 fA.

Where guard tracks run on the pc-board, and where a conformal coating of solder resist covers the board’s surface, it is a good idea to expose the guard to air. This arrangement ensures that the guard barrier remains effective even in the presence of surface contaminants and humidity.

Do you believe in miracles? How about an ambitious family of data recovery devices that pushes performance skyward while keeping power demands in check? With locked-in accuracy.

Believe it. It’s the pacesetting data recovery solution you expect from the experienced Silicon Systems design team.

Just name your application and we can match it. With multiple encoding/decoding schemes and 5-48 Mb/s programmable data rates in a wide range of packaging options. All meeting your need for design flexibility. And all featuring the enhanced window-centering accuracy and sharp error control we achieve through our unique, patented phase-lock loop design.

Miraculous, but true.

To find out more on how our MSICs (Mixed Signal Integrated Circuits) data recovery story fits into your disk drive design plans, call us to receive our comprehensive Storage Products Data Book and literature package SPD-10.

We’ll connect you with your nearest Silicon Systems representative and update you on our latest developments. 1-800-624-8999, ext. 151.

A concept of conversion:
Modular ISDN bit rate adaption.
If you switch to ISDN, bit rate adaption is one of the main issues. To move freely for economic made-to-measure solutions, we offer you the PSB 2110 ISDN Terminal Adapter Circuit (ITAC) – and a fascinating concept of modular bit rate adaption.

For one, the ITAC complies with established standards (X.30, V.110, ECMA 102) when transmitting data from existing terminals (V.24, RS232, X.21bis) onto one of the ISDN 64 kbit/s B-channels. Since it performs the framing in hardware, it is a very efficient adapter not in demand of any microprocessor support, while converting the data. Furthermore, the ITAC includes an UART controller and a HDLC controller, both required for V.120 and DMI mode2 transmission standards. Based on these and other key components, we offer you optimised solutions for ISDN terminals: a terminal adapter for X.21 and V.-series interfaces, a PC-add-on card and a multifunctional terminal covering all ISDN applications. Can there be better reasons to convert to the modular bit rate adaption concept?

For details, call (800) 456-9229, or write Siemens Components, Inc., 2191 Laurelwood Road, Santa Clara, CA 95054-1514. Ask for literature package M12A011. ITAC is a registered trademark of Siemens AG.
Make all these disappear.

Poof, they're gone. Bulky battery packs, slow hard disks and more. You see, where memory cards make sense, the new Intel 4MB Flash Memory Card provides a high-density, read/write, truly nonvolatile portable storage solution.

The real trick, of course, is that it allows you to store large amounts of code or accumulate data in a small, rugged card that uses less power than traditional memory technologies. So now you can design products that are faster, lighter, tougher and more energy efficient.

Not tomorrow, but today. Thanks to our System Developer's Kit. A DOS-compatible package that includes a 1MB Flash Memory Card, an add-in board as well as design information. In addition, it includes an evaluation copy of Microsoft's Flash File System software. All the stuff to get you started—now!

Plus, Intel's Flash Memory Card is the first to comply with the 68-pin PCMCIA/JEIDA standard. This allows the card and its data to be interchangeable between a host of...
With this simple card trick.  

Want to know more about the secrets of this amazing technology? Then call (800) 548-4725 today and ask for Literature Packet #C8A01. And start performing your own disappearing tricks.

CREDIT-CARD-SIZED MEMORIES

Small memories take on wider applications

The idea of credit-card-sized memory cards isn't really new. But two trends are spreading the idea out from niche applications toward widespread use. First, the ICs such memories use—both volatile and nonvolatile—continue to increase capacity, consume less power, and drop in price. For example, Sharp has a 32M-bit masked ROM chip under development that will go into credit-card-sized memories nicely. Second, laptop computers promise to be a significant, high-volume application for these memories as a replacement for floppy disks.

Recently, a group of laptop-computer makers, memory-device vendors, and IC houses formed an association called the PC Memory Card International Association (PCMCIA). This group has endorsed a Japanese industry standard for use in laptop computers. Therefore, certain credit-card-sized memories and their supporting hardware and software will become an inexpensive design element that engineers can incorporate into a host of future products.

Not the only game in town

Note that other manufacturers already have non-PCMCIA credit-card-sized memories available for niche applications. For example, Dallas Semiconductor designed such a memory for security applications. The company rates its memories for 50,000 insertions and withdrawals—far more than the PCMCIA-spec cards can withstand. These memories have only five contact pins. The company forms the contact pins from an extra-thick layer of a proprietary alloy.

Mitsui offers credit-card-sized memories that have no contacts whatsoever. They feature serial access at 500k bps and come in 8k, 32k, or 128k bytes of battery-backed or CMOS RAM. Prices start at $50.

Schlumberger has shipped more than 50,000,000 of its Smart Cards primarily in Europe. This series includes both μP-equipped cards and memory-only cards. Most of the company's credit-card-sized memory cards hold only a few hundred bytes—a small multiple of the data that a magnetic-stripe card holds. Similarly, Datakey has security-oriented credit-card-sized memories that extend its line of electronic keys.

If present trends continue, expect

The Most Diverse Family In Memory.

A Complete Line Of 1-Meg SRAMs.

Call Sony first. The largest selection of 1-Meg SRAM assures you can find the high performance, highly reliable memory you're looking for with just one call, so why go on a safari?

Fast or slow. Hot or cold. Even your massive memory requirements are right here.

And we can ship the package styles most in demand for your new designs today - and tomorrow. Our new production facility in San Antonio, TX will build on the reputation for timely delivery that has made us a breed apart.

The Best Selection Of New SRAMs.

-40° to +85°C, 3 volts and X9.20 nsec

If your current designs incorporate the latest technology, call us. Virtually every new idea in SRAM will be here at Sony first. And our U.S. design team (with their 0.8 & 0.5-micron CMOS technology) stands ready to get you the right product for your design; whether it's for a laptop or workstation.

Call Sony First.

We've got the product, backed by the Sony commitment to quality and service. And at competitive prices that make us the King of the SRAM Jungle.

Call today 714.229.4190 or 416.499.1414 in Canada. Or fax us your current requirements for a quick response from our technical staff 714.229.4285 (fax) or 416.497.1774 (fax/Canada).

Credit-card-sized memories

several industry-standard credit-card-sized memories to serve most applications. And, expect a gaggle of specialized devices for niche applications, such as security and ID cards.

Sticker shock
Right now, as is common for recently introduced electronics, the higher-capacity cards have prices that are orders of magnitude higher than the cost of their constituent parts. For example, Sharp’s RAM ICs used in these memories sell for $1/Mbit. Expect credit-card-sized memory prices to drop rapidly.

Mitsubishi has PCMCIA static RAM (SRAM) versions of these memories ranging from 128k bytes to 2M bytes. They also have dynamic RAMs (DRAMs) ranging from 512k bytes to 3M bytes, EEPROMs ranging from 8k bytes to 192k bytes, one-time programmable ROMs ranging from 128k bytes to 2M bytes, and masked ROMs ranging from 512k bytes to 8M bytes. Prices start at $80 for 128k bytes, $121 for 256k bytes, $208 for 512k bytes, $613 for 1M byte, and $1163 for 2M bytes.

Shigema (Fujisoku of Japan) has a 1M-byte PCMCIA SRAM credit-card-sized memory that costs $100 (1000). Intel, on the other hand, advocates credit-card-sized memories bearing flash memories. Intel cards have a 250-nsec access time and block-erase times of one or two seconds. The 1M-byte cards cost $298

Credit-card-sized memories

(1000), and the 4M-byte cards cost $1198 (1000). Intel also has a flash-memory developer's kit for $500. Databook can supply PCMCIA "disk drives" ranging from $89 to $399.

Credit-card-sized memories will supplant rotating memories in some applications. But don't count rotating memories out just yet. Like the glass CRT, reports of the imminent death of rotating memories have proven to be wrong. Every time solid-state memories have made a jump in capacity or executed a drop in price, rotating memories have responded with a doubling in capacity and a halving in size. Credit-card-sized memories will have their biggest impact in applications that rotating memories cannot serve, rather than driving rotating memories from their own turf.

Application areas

Credit-card-sized memories are also more expensive than rotating memories, and therefore not appropriate for all removable-memory applications. Right now, these memories have two possible applications: industrial and commercial.

Credit-card-sized memories are good in industrial applications because they are solid state, and therefore much more rugged and reliable than rotating memories. You could, for example, design credit-card-sized memories into vehicular, factory-floor, and high-reliability medical applications.

For commercial applications the small size and low power consumption of credit-card-sized memories predominate. Consider laptop computers, for example. Low-power components need only a small battery. A smaller battery, in turn, permits a smaller, lighter computer. In addition to laptops, these memories should also prove useful for inventory loggers, calculators, and other small, computerized implements. Indeed, the highest-volume existent application for PCMCIA cards is for Sharp's Wizard series of pocket-sized business computers.

Other than roughly similar outlines, the available and proposed credit-card-sized memories have little in common. They differ in the IC technology they employ, in their pinouts and other physical characteristics, and in their software structures.

Even within a given standard, variations exist. The PCMCIA standard is an umbrella that allows two card thicknesses: regular and pregnant. Pregnant cards contain UV-erasable PROMs and have a removable window cover so that you can erase the EPROMs. The standard also allows all common nonvolatile memory technologies: battery-backed RAM, ROM, EPROM, EEPROM, and flash EEPROM. Each of these technologies mandate significantly different access times and methods for writing and erasing memory contents.

The PCMCIA standard further allows a variety of data formats. All these allowable, incompatible variations arise from the fact that the PCMCIA members have differing requirements and also because some have existing formats and technologies that they do not care to change.

Applications can use the credit-card-sized memory in three ways.

One approach replaces a floppy disk with a credit-card-sized memory. This approach entails all the software overhead of a file-management system, such as device drivers.

Another approach is to simply use the credit-card-sized memory as a repository, or log, of raw data. This approach requires only simple read/write routines. Third, you can run programs directly out of credit-card-sized memory space. This approach offers flexibility to simple factory-floor computers, such as industrial versions of the IBM PC, which now tend to have "hard-wired" software dedicated to a single program.

Beyond the straightforward, common-sense application for these memories, the cards' designers may have done, as engineers often do, something very important while trying to do something else. Running programs directly out of credit-card-sized memory space offers a solution to the problem of software piracy by thwarting the threat that centralized data bases pose to our civil liberties. Butressed by appropriate new privacy laws, credit-card-sized memories could easily allow individual citizens to centralize and control others' access to private data.

EDN
When you’re not the first you’ve got to be the best — a strategy that applies to your motion control design and DDC’s breakthrough monolithic tracking Resolver (and LVDT) to Digital Converters — the RDC-19220 Series. Application specific features such as +5V only operation, differential resolver and LVDT input modes, Built-In-Test, programmable resolution, tachometer quality velocity output, and high tracking rate crush competitive silicon to sand. DDC has tailored its features and pricing to your competitive needs.

The RDC-19220 Series offers single IC converters in small 40 pin DDIP, 28 pin DDIP, or 44 pin PLCC packaging and offer user programmable features such as resolution, bandwidth (to 1060Hz), and analog velocity output scaling. It accomplishes full programmability, and power supply decoupling with only seven external passive components. Resolution programming allows selection of 10, 12, 14, or 16 bits, with accuracies to 2.3 minutes. This feature combines the high tracking rate of a 10 bit converter (up to 2300 rps) with the precision and low-speed velocity resolution of a 16 bit converter in one package.

The velocity output from the RDC-19220 Series, which can be used to replace a tachometer, is a 4V signal referenced to ground with a linearity of 0.75% of output voltage. With a single resistor, the user can set the full scale value of VEL.

The RDC-19220 Series offers an extremely versatile and rugged input signal front-end for electrically harsh environments. Differential signal inputs enable improved noise rejection and will accept either sinusoidal (resolver) or triangular (LVDT) waveforms in a carrier frequency range from dc to 40kHz. The device is input transient proof to 100V and is power-supply and signal turn-on sequence insensitive.

RDC-19220 Series converters are available with operating temperature ranges of +65 to +70°C, -40° to +85°C, and -55° to +125°C, and military processing is available (consult factory).

Individual models are as follows: The RDC-19220 is in a 40 pin DDIP package with differential inputs and ±5V power supplies; The RDC-19221 is in a 28 pin DDIP package with single-ended inputs and ±5V power supplies; The RDC-19222 is in a 44 pin PLCC package with differential inputs and ±5V or ±5V power supplies; The RDC-19223 is in a 40 pin DDIP package with single-ended inputs and ±5V or ±5V power supplies.

Typical applications include motor control, radar antenna positioning, machine tool control, robotics, and process control.

Doesn’t your new design deserve the RDC-19220?

For additional information, contact Mike Johnson at 1-800-DDC-1772, ext. 384.
Surprisingly, it doesn’t cost much to move into our 32-bit architecture.

You don’t need a French Provincial budget to move into the i960™ SA/SB processors. Not even close. In fact, at under $20, the i960 SA/SB processors are comparable in cost to a 16-bit system. And yet, with a full 32-bit internal architecture and a 16-bit data bus, they give you five to six times the performance of any other 16-bit embedded processors.

Or in other words, for almost nothing down you can own an impressive new home. With an architecture that’s perfect for today’s more demanding applications, such as entry-level page printers, I/O controllers, and communication products.

Naturally, when you move up to a 32-bit architecture, you want to be sure it’s a place where you can stay and grow. Which is why you’ll be happy to know that the i960 SA/SB processors
are part of a close-knit neighborhood of Intel SuperScalar i960 microprocessors. So you get software compatibility across the board as well as an easy performance path up to 100 MIPS.

And while great price/performance and compatibility are important, they’re not the only reasons some very important companies have already moved into the i960 line. They were also impressed with the comprehensive array of development tools and the outstanding technical support that made them feel right at home with the technology.

So when you are ready to move into the i960 SA/SB line, call 800-548-4725 and ask for the 960 Welcome Guide. We’ll not only make the move less expensive, we’ll even help you set up.
The next generation of IDC Interconnection:

Same performance, one-half the size.

System 311 is the next generation of reliable high performance IDC mass termination systems from Thomas & Betts, a pioneer in the development of IDC. A natural evolution, the new System 311 combines the finest capabilities of our proven Ansley® IDC System, downsized and precision engineered to terminate .025 pitch cable. Performance-oriented features make System 311 the new standard in IDC fine pitch systems — a beryllium copper contact with a dual mating beam that provides greater than 100 grams normal force (150 KPSI Hertz Stress), a unique “coined-slot” IDC contact joint, one piece housing design,
Contact-to-Conductor Relationship – Thomas & Betts’ “coined-slot” contacts are designed to position the terminated conductors within a specified region for maximum conductivity and reliability.

Precision Lead-In Design – assures that repeated connect/disconnect functions are consistently smooth and without pin damage.

Our Own Vertical Eject Design – saves board real estate and ensures positive locking and easy disengagement of header from mating socket without stress to cable, contacts, or solder joints.

and high performance materials are combined to ensure excellent system integrity and maximum reliability.

System 311 incorporates these customer-requested features into a compact interconnect system with board space savings of up to 50%.

From cable to connectors to application tooling, System 311 is designed to meet or exceed the most stringent customer requirements for fine pitch IDC mass termination.

For complete information or help with a specific application, call or fax: Thomas & Betts Corporation, Electronics Division, 200 Executive Center Drive, Greenville, S.C., Phone: 803-676-2900, Fax: 803-676-2991.

For the new System 311 Catalog call 800-344-4744.
Power Revelation

Our Westcor division's family of configurable AC or DC input fan cooled StakPAC switchers reveals a new world of power density and output flexibility to the system designer...whatever your power needs. Each StakPAC is built with field proven robotically manufactured Vicor VI-200 Series power components providing you the flexibility of a customized supply combined with the off-the-shelf availability of standard catalog products...“first article” StakPACs are typically delivered in 2 weeks.

Compact, up to 6W/in³, low profile StakPACs set the standard for "box" or open frame switchers. Besides meeting conducted EMI standards, custom configured StakPACs are pre-approved to UL, CSA, TÜV and VDE safety standards (DC Mini- in process).

Whether your application is OFF-LINE or DC INPUT, chances are we have a solution for you...we are designed into computer, telecom, and test measurement systems worldwide. Please call us to discuss your needs, then relax...bulky standards and risky long lead-time custom supplies belong to the past. Discover the new world of configurable supplies: StakPAC, MiniStakPAC and DC Mini.

Call VICOR EXPRESS for information and be sure to ask for a StakPAC or DC Mini Handbook: (800) 735-6200 or (508) 470-2900 at ext. 265. Or call Westcor (west coast) at (408) 395-7050.

Compact, fast-sampling, 500-MHz scopes talk to users in words and pictures

You might say that Tektronix intends its TDS series of compact, high-speed-sampling, 500-MHz-bandwidth digital storage scopes to do for the instrument manufacturer what the K car (or maybe the minivan) did for Chrysler Corp. If you look at the scopes' combination of features and specs, you can legitimately call these products revolutionary—even though, with one possible exception, no single feature is a first. Considering their high performance and middle-of-the-road pricing, the scopes offer a good value. (A 2-channel unit costs $9490; a 4-channel unit costs $13,900. Delivery takes six weeks ARO.)

The one feature that probably is unique in the 500-MHz DSOs is the 10-µV resolution. This spec requires a little explanation. These scopes have 8-bit ADCs. (Data on effective bits vs frequency is not yet available.) You can obtain the extreme resolution only if the scopes are placing no more than 1M sample/sec in their waveform memories. In this case, real-time DSP (using the proprietary Tri-Star µP also used in the vendor's much higher priced DSA 601/602) increases the scopes' resolution to 12 bits and allows vertical-scale expansion.

The scopes achieve the resolution enhancement by sampling at high rates and creating a short-term average in real time. Only the average goes into waveform memory, so averaging exacts no penalty in memory depth; at maximum sensitivity, it lets you clearly see 10-µV signals. Such high sensitivity is of interest mainly to people doing low-level analog design. Other features will interest a wider audience. The triggering is much like that on logic analyzers, allowing very complex sets of conditions to trigger a sweep. You can trigger on logical combinations of inputs, logical combinations qualified by a clock, undersized (runt) pulses, pulses whose width exceeds a minimum you set, and much more. The scopes perform waveform math and make 22 preprogrammed measurements. As you would expect, the scopes produce hard copy on graphics-capable printers, and they connect to computers and measurement systems via an IEEE-488.2 interface.

The fast DSP chip provides the quick response (also called "analog feel") of the company's DSA units. Lowpass input filters (which the company says lack sufficient attenuation to qualify them as true antialiasing filters) have corner frequencies that change automatically as you change the sampling rate. The result is a minimum of aliasing problems. Unlike some competitive fast-sampling DSOs, these scopes do not include output reconstruction filters. At the expense of bandwidth, such filters improve repeatability in displays of single-shot pulse edges.

The standard memory depth is 15k samples/channel. An option ($1500 on the 2-channel unit; $1950 on the 4-channel unit) increases the memory depth to 50k samples/channel. These products indicate an industry trend toward deep memory in wide-band scopes. A competitor has been offering 50k-sample waveform memory in such scopes for several years.

You probably noted that the description of the units as high-speed sampling scopes failed to mention a maximum sampling rate. The reason for the omission is the complexity of the spec. These scopes can increase their single-shot sampling rate on one channel by interleaving samples from an ADC they borrow from an unused channel. Some of the vendor's other high-performance scopes also operate this way. Each ADC converts at a maximum speed of 250M samples/sec. Hence with one channel active, the 2-channel unit can take 500M samples/sec, and the 4-channel unit can take 1G sample/sec. When you view repetitive waveforms, the effective sampling rates are much higher.
Prescience (pronounced PRE-shence) brings you the complete mathematical solution for the Macintosh: Theorist and Expressionist. Theorist is the symbolic algebra and graphing program that is easy to use and powerful, but only requires one (1) megabyte of memory. You don’t need to learn how to program, memorize syntax rules, or read a large manual since Theorist actually displays and interactively solves real equations on screen—step by step—the way you do on paper. 2-D and 3-D graphs, contour and density plots, solids, as well as animation files, are easily created and saved in PICT, EPS, or PICS formats for high quality output. Your equations can be exported to Expressionist, the leading equation editor, for typeset-quality results in your word processing and page layout documents. Both programs are simple enough for the student, yet powerful enough for the professional educator, scientist, and engineer. Our programs enable you to concentrate your time investigating and presenting your work, not learning how to! For more place an order, call or write to the address below.

(415) 543-2252 Fax (415) 882-0530

Another unusual feature is the user interface; its operation appears to be highly intuitive. A complete set of rotary controls is available, but you use only one set for all the vertical channels—even on the 4-channel unit. (The 2-channel unit will display two live waveforms and two computed waveforms.) Push-buttons let you select which channel you are controlling. The monochrome raster technology and displays white on black.

There are rows of buttons along the right-hand and lower edges of the CRT. Often, making a menu choice involves pushing a button from each group, but there is no further nesting of menus. A combination of words and pictures describes many of the menu selections. Whenever icons appear, words always accompany them.

At the right side of the front panel, a calculator-sized numeric keypad permits quick entry of numeric values—for example, large offsets on the X and Y axes. If you don’t know what numbers to enter, as is often the case, you can adjust the large rotary control just above the keypad until you reach the value you need.

Internally, most of the scope is on one densely packed pc board, on which are surface-mounted proprietary chips, multichip modules that contain other proprietary chips, and discrete components. Battery-backed CMOS RAM stores all trim values. A high-resolution DAC converts the stored values and sends the analog levels to S/H circuits. No mechanical adjustments at all are necessary for potentiometers or trimmer caps. The company claims that although trimming with multiple DACs of equivalent resolution would have done away with the S/H circuits, such a design approach would have been much more expensive.—Dan Strassberg

Mil/Pac™ high-density military power supplies.
Now you can order Abbott's full mil-qualified compact power supplies in both DC and AC input models.

Mil/Pacs come in 20W, 35W and 50W configurations, with single (5, 12, 15, 24, or 28V) or dual (±12V; ±15V) outputs.

DC-to-DC models accept input from 14V to 32V. AC-to-DC models accept 103.4 to 126.5V rms, 47-440 Hz single phase.

All Mil/Pacs operate at temperature extremes from -55°C to +100°C. All are designed with a field-proven topology that has been verified by rigorous environmental stress screening.

Mil/Pacs are available with or without MIL-STD-2000. Either way, the specs are worth reading. Just write us at 2727 South La Cienega Bl., Los Angeles, CA 90034. Or call (213) 936-8185.

EDN June 20, 1991
Floating-point DSP chip runs at 60M flops and addresses 4G words of data memory

There's little left to debate on the merits of floating- and fixed-point math DSP operations. Today there are many floating-point DSP chips that compete with fixed-point devices on price and performance. Now you can add Analog Devices to the list of companies that supply floating-point DSP chips. In mid-May, the company introduced its ADSP-21020 at the International Conference on Acoustics, Speech, and Signal Processing (ICASSP) in Toronto.

The DSP chip is available in two speed grades that operate at 15 MHz ($195) or 20 MHz ($265). Prices are for single chips. The 15-MHz chip's floating-point processor operates at a peak rate of 45M flops, and the 20-MHz part operates at 60M flops. The company expects to supply a 25-MHz version of the chip late in 1991. The floating-point processor operates with both 32- and 40-bit floating-point values in the standard IEEE numeric format. The chip also operates on 32-bit fixed-point values, and it can accumulate a result with as many as 80 bits. Because the DSP chip furnishes an ALU and a multiplier that are independent of one another, the chip can simultaneously execute an addition and a multiplication operation—both of which are key to DSP operations. In comparison with other DSP chips, the 20-MHz version of the chip performs a 1024-point complex fast-Fourier transform (FFT) in 0.96 msec.

The company also uses a formula to compute the performance of the ADSP-21020 relative to a Texas Instruments TMS320C30-40 DSP chip. The relative "C30-equivalent" spec is given as "80 C30 MFLOPS" for a 1024-point complex FFT run on each DSP chip. We urge caution in applying such benchmarks. After all, the performance of a variety of chips running FFT benchmark programs may not be applicable to all possible DSP tasks. In the end, how a given DSP chip operates depends to a great extent on your application, on the limits of your hardware and software, and on your development tools.

The ADSP-21020 employs a modified Harvard architecture in which the data memory stores data, and the program memory stores both instructions and data. Thus the chip can fetch information from its data memory, information from its program memory, and an instruction from its internal cache, all within a single cycle. Because circular buffers are frequently used in
RAY FELTON MEETS AN ICY CHALLENGE

OEM Control Computers Tested from -40° to +85° C

Quality Manager Ray Felton tests our new Rugged series CPU boards for the toughest conditions faced by industry.

Rugged boards are designed to work on a truck in Alaska, in a steel mill in the tropics, or anywhere in between. The STD Bus format keeps the cost low and design flexibility high.

Software development may be done on a PC using Borland's Turbo C++ and Cubit's C-Engine Software. Cubit will even design and manufacture custom I/O boards to complete your system in OEM quantities.

To learn more, call our Application Engineers June Sabbah or Richard Fertell at 415-962-8237.

"Heat and cold, shock and vibration challenge control electronics on the factory floor and in field applications. I test our new Rugged series control computer boards to assure you they will meet these challenges."

DSP operations such as filtering and running FFTs, the chip lets you implement circular buffers in its external memory. The device handles buffer-address wraparound—the point when the buffer pointer reaches its maximum value and must be reset to the buffer's starting address. Circular buffers aren't constrained to specific places in memory, but can start at any address and can be any length.

The chip's program memory can contain as many as 16M words (16 bits per word), and its data memory can contain as many as 4G words. For execution at a 20-MHz clock frequency, you'll need DRAMs (dynamic RAMs) with 35-nsec access times for zero-wait-state operation of the processor. Wait states are programmable, and the chip supports page-mode DRAM addressing.

Besides the chip, the company supplies a variety of development hardware and software—as do third-party suppliers. The assembler, linker, and assembler package are available for $995. The programs run on an IBM-compatible PC. For $500 you can buy a development board that communicates with a host computer over serial I/O lines. The company is also supporting a superset of ANSI C, called Numerical C, which will offer additional vector and matrix operations as part of its language.

Motorola Introduces a Real Turn-Off!

New integrated Power MOSFET turn-off devices. Each packs the switching power of four components into one tiny package.

It's here from Motorola—the MDC1000 Series, a new family of SMALLBLOCK™ MOSFET Turn-Off devices that simplify circuitry and component count and reduce circuit board real estate.

The MDC1000 Series provides an economical and space-saving method of turning off a Power MOSFET in tens of nanoseconds, while achieving a high level of circuit improvement by reducing the component count of an active gate turn-off network for MOSFETs.

One tiny MDC1000 chip replaces a zener diode, a signal diode, a resistor, and a PNP transistor. The MOSFET Turn-Off quickly discharges the gate-source and gate-drain capacitances when the input signal is removed, and provides protection of the gate-source in the event of an overvoltage condition on the control line.

Motorola's MDC1000 devices can be used in most applications in which it is necessary to increase the turn-off speed of the MOSFET gate, including PWM circuits in switchmode power supplies, DC-DC converters, brushless and brush motor controls, and horizontal output gain circuits.

Interested in turning on to Motorola's new family of Power MOSFET Turn-Offs? Then call toll-free today at 1-800-441-2447, or send the coupon below for the Motorola MDC1000 Series Sample Kit, or write to Motorola Semiconductor Products, Inc., P.O. Box 20912, Phoenix, AZ 85036.

Math software runs under MS Windows, handles symbolic math, and accesses handbooks

In many ways the mathematical software package, Mathcad V3.0, is a totally new product. It runs under MS Windows V3.0 and incorporates several features intended to further increase the software’s usefulness.

The product’s most noticeable feature is its “live-document” interface. Underlying that interface is the premise that engineers and scientists don’t want to spend lots of time becoming experts on using the tools they employ to solve problems; they just want to get on with the problem solving.

Much of the other mathematical software targeted at the engineering and scientific communities requires you to study and practice extensively before you become competent enough to apply it successfully. On the other hand, spreadsheets, which are quite popular among engineers, let you get into problem solving quickly enough, but in significant ways are poorly suited to technical work. For example, once you’ve entered an equation into a spreadsheet, you are hard pressed to recognize it as the equation you know and love (or, perhaps, hate). Using Mathcad, the equations on the screen look the way you’re used to seeing them.

You enter your problems in a free-form document in which you can place text and equations. If the solution of a problem is best described in the form of a 2-D or 3-D graph, the software can plot the graph and insert it in the document. If you define a variable at one point and use it in equations elsewhere, as soon as you change the variable definition you can see the effect of the change throughout the document.

The new MS Windows-based version adds further embellishments. Although different users may argue about which of these added features is the most important, many users are likely to agree that the new version’s ability to handle symbolic math is at the top of the list.

When categorizing mathematical software, the customary approach is to divide the packages into numeric and symbolic solvers. Numeric solvers can determine the roots of equations if you supply them with values for all the independent variables. They can even calculate families of solutions over a range of independent-variable values. What they can’t do is express answers as equations that contain the independent variables in literal form. To perform the last function, you need a symbolic solver. One of the best known and most respected symbolic solvers is Waterloo Maple Software’s (Waterloo, ON Canada) Maple. Mathsoft has signed an agreement with Waterloo Maple to permit the use of Maple routines in Mathcad V3.0.

You don’t get all of Maple in Mathcad, but what you do get should satisfy a large group of users’ symbolic-solution needs. Although the symbolic solver springs to life at the touch of a mouse button, the integration of the numeric and symbolic capabilities is not totally seamless; you have to shift gears mentally when you change modes. Mathcad’s designers claim that in their testing with users, attempts to force a seamless transition proved more confusing than helpful.

Another major feature of V3.0 is the on-line handbooks. The first of these contains such items as conversion factors and physical constants—for example, the densities of common solids and liquids. Future handbooks will contain much more data and will take advantage of Windows’ hypertext capabilities to permit access to photographic images as well as the numbers, text, line drawings, and graphs of the initial handbook.

The third significant addition is the package’s desktop-publishing capability. (Earlier versions produced documents that looked like the output of a scientific word processor.) The company is quick to point out that the new version is not a desktop publishing program. Anyone who buys it as such will quickly become frustrated by the
Analog Devices delivers mixed-signal technology that meets today's most demanding specifications.

UPDATE

absence of such features as indexing and footnoting. However, there are enough desktop-publishing features to permit engineers to turn out very attractive reports.

Enough questions have been asked about the operating speed of MS Windows-based products to warrant inquiries about speed each time a Windows-based productivity tool makes it debut. If you run V3.0 and its predecessor on equivalent hardware, and you time the operations, some will be faster and others will be slower. Overall, though, your impression of the new version is likely to be that it is faster, because the operations you focus on, such as graph plotting, are faster.

V3.0's added capabilities exact a price in system requirements. Although the new version does not require all of the following hardware, the company does recommend it, and you'll need most of it to run Windows 3.0 acceptably. The items consist of an 80386SX-based PC with 4M bytes of RAM; a display that conforms to the IBM enhanced-graphics-adapter or video-graphics-array standards (monochrome will do); a numeric coprocessor; a mouse; and a hard disk with 6M to 7M bytes of free space.

The new version can read files created with earlier versions, but these versions cannot load documents produced by V3.0. For users whose hardware does not support V3.0, the company will continue to supply the prior version, V2.5 as well as a version for the Apple Macintosh. Both IBM versions list for $495; an upgrade from V2.5 to V3.0 costs $149 ($99 until June 30, 1991).—Dan Strassberg

Tap into 25 years of experience at our high-speed and mixed-signal design seminars. You'll learn new techniques that'll get your applications to work more quickly, and you'll get design manuals that put all this information right at your fingertips.

Perfect on-time delivery—it's our goal and at 97% we're getting close, thanks to our continuous improvement process based on Total Quality Management. Over 150 TQM teams make the customer and quality improvement the focus of our entire organization. A focus that gets translated into not just catchy slogans, but real action.

Our Spectrum CAD Tool is 100 times faster than traditional SPICE programs, so it makes quick work of mixed-signal ASIC design cycle time.

In the disk drive market, you've got to be fast—in both performance and time-to-market. That's why seven of the top 10 disk manufacturers rely on Analog Devices for mixed-signal components.

Today, Analog Devices offers more high-performance mixed-signal components than anyone else. And we get them to you fast. So if you want mixed-signal ICs that'll help you design faster performing products, from a company that'll help you get your product to market faster, call us at 1-800-262-5643.
Data-acquisition software uses icons and menus to get your job up and running fast

The folks at Keithley/Asyst Software aver that with Easyest LX, acquiring, manipulating, and displaying data with the aid of an IBM PC or compatible will never be the same. A demonstration of the software suggests that they aren’t exaggerating.

If you’re skeptical about icons and scoff at packages that base their human interfaces on scores of the tiny pictures, you may be inclined to poke fun at this software. But before you laugh too loudly, take a closer look. The designers of this software have blended images with words in a way that leads you to your objective with a minimum of pain. Each time you position the mouse on an icon, the name of the function it represents appears at the lower-right corner of the screen. If you click a mouse button, a longer description of the function appears in the center of the screen.

You select all of the program’s functions by clicking on icons. The icons appear in several columns along the sides of the screen and in a row across the bottom. Except in the runtime mode described below, all of the icons are visible all of the time. The center of the screen is available for displaying data and messages and for displaying and editing procedures you create. The package has extensive graphing capabilities. It can create 2D- and 3-D graphs of several types from acquired data. Its data-manipulation functions include FFTs.

Although the software runs in an interactive mode, you can also use it to generate programs that mechanize complex or repetitive procedures. Several packages that do away with conventional text-based programming replace it with a process of connecting icons to form block diagrams on the screen. This package frees you from the need to create such diagrams. It automates program generation by recording keystrokes and mouse clicks. However, unlike most programs that record keystrokes, the package doesn’t reproduce procedures by simply playing back what you typed in. Instead, the software generates an ASCII file from the keystrokes and then compiles the file.

A benefit of this approach is that, unlike strings of keystrokes, the ASCII files are easily readable; they contain mnemonic versions of the commands. The program lets you read the files in three ways. The View function displays a short version; the only editing available in View is deletion of commands. The Edit function displays a version of the file in which all commands are fully expanded to show arguments. In Edit, you can make any changes you like. You can also view the file as a flowchart. Even if you don’t think in flowchart terms, seeing your procedure displayed in this graphical form can simplify debugging. Moreover, the flowcharts provide reassuring evidence to non-programmers that, even without training, they can write programs.

In addition to its interactive and normal-execution modes, the package has a runtime procedure-execution mode. In this mode, a user need not even be aware of the package’s presence. (You can set up the runtime mode to make all of the package’s usual menus and prompts disappear.) Currently, however, there is no separate runtime-only version of the package. To invoke the runtime mode, the entire pack-
Picture this—a PC monitor that offers the same color and clarity as a high-end engineering workstation costing as much as 20 times more. Our pin-compatible RAM-DAC is literally redefining the low end of the PC monitor market.

'Try, try again' is a costly way for manufacturers to find the best design solution. So to help our customers find answers to tricky problems the first time around, technical application engineers are just a phone call away. In some instances, they're even located right on the customer's premises.

After analyzing semiconductor suppliers, many of the leading oscilloscope and spectrum analyzer manufacturers chose Analog Devices for their mixed-signal components. One reason is our ability to deliver high performance at high levels of integration—for example, our AD640, which replaces a chain of discrete log-amps for higher accuracy.

With our motion control ICs, several major aircraft companies are staying right on course. High reliability and accuracy are hallmarks of our 2580, AD598 and the rest of our nearly 400 defense-qualified products.

Today, Analog Devices offers a better line of high-performance mixed-signal components than anyone else. And no one has a better record for reliability, or more experience in analog, DSP and mixed-signal ICs. If you want mixed-signal components that will help you design better products, the best thing to do is to call us at 1-800-262-5643.

Continuous Edge Graphics is a trademark of Edwards Laboratories.
The STD-AT™ is the first 80286 IBM-AT compatible STD Bus computer offering over 18 times the performance over a standard XT. The compact 4.5" x 6.5" STD Bus card size makes it ideal for mounting in disguised and embedded controllers in a wide variety of industrial and commercial applications. The STD-AT is the blending of proven hardware and software standards to provide the most rugged, compatible, cost effective industrial solutions.

UPDATE

Asyst Software has long been an advocate of standardizing the command structure of IBM PC-based data-acquisition boards. So far, the results of the standardization effort have been mixed. But a notable result is a manual that describes how to write drivers for the boards to make them compatible with the firm's data-acquisition software.

Because the package complies with all of the company's rules of its older software, it can use the large library of drivers already written for the firm's older software. Thus, the LX version is compatible with scores of boards. Moreover, the package can import ASCII data files, so you can use it to process and display data acquired elsewhere. It can also import graphic files in .PCX format. This capability can let you display a picture of a pc board on which a technician is to make measurements. On the picture, you can indicate where the technician is supposed to place the test probes, and you can superimpose the measurement results at those points.

Easyest LX even runs on IBM PC-compatible computers whose CPU chip is an 8088. Main memory of 640k bytes and expanded memory (or extended memory configured as expanded memory) of 1M bytes is required, as is a mouse, a numeric coprocessor, and a display that supports the IBM EGA or VGA standards. Monochrome displays must allow the use of a gray scale to represent colors. The package is available now. In single quantities, it costs $1295. Owners of the original version of Easyest can upgrade for $530.—Dan Strassberg

Keithley/Asyst Software, 100 Corporate Woods, Rochester, NY 14623. Phone (800) 348-0033; in NY, (716) 272-0070. FAX (716) 272-0073.
More gadgets for less money, and make it work better—that's the only way to survive in consumer electronics, the most competitive market there is. That's why three of the top five Japanese electronics firms rely on us to meet their mixed-signal needs in applications ranging from CD players to video cameras.

We're far from your local component boutique. Over half of our $540 million in revenues comes from international sales. And with manufacturing and stocking facilities on just about every continent, getting products to you quickly is a snap. Plus multiple manufacturing facilities allow us to take advantage of the right talent and processes for the job at hand.

With billions of dollars in annual sales at stake, the video game market is anything but child's play. One leader in this market found that with our DSP they could create more realistic and interactive games. As a result, they're driving away with a bigger share of the market.

Today, Analog Devices offers more cost-effective solutions to your high-performance mixed-signal needs than anyone else. Solutions that are surprisingly affordable, whether they're available off the shelf or developed for a specific application. To find out more about how we can help you develop products more efficiently, or for a free copy of our recent Mixed-Signal Technology white paper, call us at 1-800-262-5643.

SOUNDPORc DACs—We've made these DACs cost-efficient by making them complete with output amplifier, reference and digital logic interface. Perfect for high-fidelity digital audio and multi-media applications, these mixed-signal ICS achieve SNRs as high as 108 dB and THDs as low as 0.0025%.

AD712—If you're working in professional audio and compact disc applications, you'll like the sound of this—an IC that combines two high-performance op amps in one compact package. You get low offset voltage and low input bias currents coupled with superb transient response, ambience, clarity and dynamic range.

ADSP-2105—High performance DSP at an incredibly low price. So low, in fact, you can now consider DSP in a host of new applications. And since it's pin-compatible with the ADSP-2101, and code-compatible with all of our other DSP processors, upgrading is easy and inexpensive.
We can do all this in less than 350 bytes of code.

EDN June 20, 1991
We developed LONWORKS technology.
What you do with it is your business.

Spend a day in a free LONWORKS™ seminar and we’ll change the way you develop products forever.
You’ll learn about the technology that uses the latest computer, semiconductor and networking advances to add control and communication capabilities to your products. Quickly and inexpensively.
You’ll see the heart of LONWORKS, the NEURON® CHIP Small enough to fit into any product, smart enough to control and respond to other devices, flexible enough to communicate over standard media, and inexpensive enough that everyone can afford it.
You’ll discover how easy it is to program and link NEURON CHIPS into virtually invisible networks of intelligent devices.
How our LONTalk™ protocol communicates over powerlines, twisted pair, radio waves, and other common media.
How our LONBuilder™ Developer’s Workbench helps you design LONWORKS networks into your products. How to connect products into smart systems. And how to connect systems into interoperating LONWORKS environments as large as a building, a home or a factory. All in less time and for less money than it takes to develop your own protocols and tools.
So call 1-800-258-4LON for reservations. And learn about the new technology that will help you improve your products. And your business.

Stag's ZL30A offers total PLD programming support

Stag Microsystems' model ZL30A is the first dedicated Logic Programmer of its kind that not only supports programming of PLDs, EPLDs, and GALs*, in a variety of 20, 24, 28 and 40 pin DIP, but also supports programming of the latest surface mounted PLCC/LCC devices.

Stag's ZL30A contains features that have made it the industry standard in both engineering and production environments. Salient among these are:

- Powerful easy-to-use editing capability
- Super fast programming speed
- Stand alone or remote control operation
- Comprehensive device library
- Handler interface capability to support DIP or PLCC/LCC devices
- I/O formats include JEDEC, Signetics and X-Ploc
- Compatible with CUPL* software compiler
- RS232C, IEEE-488 and handler control interface ports standard
- Expansion modules accommodate 40 pin DIP and a range of surface mounted devices
- Stringent in-program checks including continuity and connect tests are automatically performed to guarantee error free stand alone or handler operation
- Supports Test Vectors
- Turn Key handler interface kits
- Worldwide sales and service support.

Futurebus+
Now you can start your design without waiting for the future.

Putting the standard to work today.

National has long been the industry leader in BTL and mixed analog + digital technology. Now we’ve drawn on that heritage to make the most highly integrated Futurebus + ICs available today. We’ve also put together a full range of development tools to help you put that chipset to work. And the entire package is available now.

Making high-speed buses reliable and affordable.

With our new chipset, Futurebus + gives you more bandwidth for your money, making it —for the first time— fully cost-competitive with VME and Multibus. In addition to an Arbitration Controller, our chipset contains four advanced BTL devices: two 9-bit Data Transceivers (latched and unlatched), a Handshake Transceiver, and an Arbitration Transceiver.

Between them, they offer you a variety of features designed to break the throughput bottleneck in high-performance computer systems:

- Glitch filters (to eliminate wire OR-ing effects)
- Filtered and non-filtered receiver outputs
- Efficiently partitioned arbitration logic (the fastest available)
- Fault-tolerant circuitry
- Live-insertion support

Providing a broad range of development tools.

Start with our Designer’s Handbook, with a slave-memory-board application note, product data sheets, and application notes on BTL design technology. Other tools include wire-wrap boards from Mupac and Hybricon, Spice models, and Verilog Behavioral models.

Bringing Futurebus + into the present.

Call us at 1-800-NAT-SEMI, Ext. 127. We’ll send you a Designer’s Handbook, and you can start your Futurebus + design today. Because there’s nothing left to wait for.

Two new ways for you to make sensitive LCZ measurements. Even if you’re sensitive about price.

Keithley has found a way to fit accuracy and value into the same LCZ meter. In fact, we've found a couple of ways.

Introducing the affordable Keithley LCZ meters: a benchtop Model 3321 and a multifeatured Model 3322. Both deliver 0.1% basic accuracy, \(4\frac{1}{2}\)-digit resolution, automatic setting of function and equivalent circuits, multiple test frequencies, and more. The 3322 adds binning and deviation capabilities, plus other value features.

Now, make reliable measurements with ease. Obtain more accurate test results. And, have some money left in the budget – maybe for some Keithley test fixtures?

Looking for a meter to make sensitive AC measurements? Talk to a manufacturer that’s also sensitive about price. Call Keithley Instruments at 1-800-552-1115.
Remember when... There were no lights in Wrigley Field? Eight megabytes of RAM was only $320,000?

Take a stroll with NEC
down Memory Lane.

1893 Grover Cleveland sworn in as president. William Wrigley, Jr. introduces Juicy Fruit and Spearmint gum at 5¢ a pack, its price for the next 78 years.

1916 Wrigley buys Chicago Cubs.

1971 Wrigley's son Philip grudgingly increases price of gum to 7¢ a pack.

1975 Chewing gum is 15¢ a pack. Eight megabytes of RAM is $320,000. 1K DRAMs are $5.

1985 NEC introduces made-in-America 256K DRAMs.

1988 Lights go on in Wrigley Field (8/8/88). NEC 1-megabyte SIMMs retail for $400. Chewing gum is a quarter.

1989 NEC ships 4-megabit DRAMs in high volume.

1990 NEC 1-megabyte memory modules (SIMMs) begin the year at less than $100. George Bush throws out first ball. NEC samples 60-nanosecond 4-megabit DRAMs in 300-mil SOJ packages.

1993 U.S. president sworn in. NEC ships 16-megabit DRAMs from its Roseville, California, submicron line. Cubs win World Series.

If the price of chewing gum had dropped as fast as memory prices, you could buy 667 packs for a quarter.

For the latest information on NEC SIMMs and 4-megabit DRAMs in 300-mil SOJ packages, remember to call NEC.
Maintaining zero-wait-state memory performance for 33- and 40-MHz μPs can exceed a system designer's pain threshold. At such high speeds, designs employing standard static RAMs (SRAMs) and external glue logic suffer from interface problems. Time delays caused by latch propagation, package-lead inductance, pin capacitance, and pc-board trace lengths can force designers to use very expensive, fast-access SRAM to make up for lost time. The added burden of timing skews and uncertainties associated with the logic transition of control signals may bring a designer to conclude that, based on worst-case timing analysis, problems associated with zero-wait-state performance are insurmountable.

Fortunately, SRAM vendors are aware of the system designer's plight. Although vendors are constantly pushing the leading edge of IC lithography to produce faster, bigger, and wider SRAM cells, they are also implementing key architectural innovations to ease SRAM chip interface problems. SRAM vendors are incorporating glue-logic and system functions into SRAM architectures to take some of the heat off systems designers.

One notable architectural innovation combatting time delays is the absorption of address and data latches onto the SRAM chip. For example, modern CISC and RISC CPUs require an address latch between the CPU and the system's cache data RAM. You can organize the memory cells for these CMOS

Each successive SRAM generation must be faster, denser, and wider to keep pace with the latest CPU speeds and architectures. But when SRAMs seem to be losing ground, innovative SRAM architectures are often the means by which memory subsystems stay in the running with today's μPs.

Most 16-MHz and 20-MHz designs employ a fast external 373-type transparent latch, which has an enable-to-latch delay of 5 to 10 nsec. However, a 33-MHz 80386 μP, which performs a nonpipelined read in 60 nsec, requires a fast-access SRAM for a cache data RAM. The search time for a tag-RAM match, before the cache controller enables the latch, is typically 20 nsec for Intel's 82385 cache controller, and the read setup time for the 80386 is 5 nsec. Therefore, the latch's enable time plus the RAM's access time must be less than 35 nsec. Additional circuit time delays and timing skews force the designer to use an SRAM that has a 20-nsec access time when employing an external latch.

The AT&T and Cypress 7C183 and 7C184 SRAMs absorb the transparent address latch onto the chip. Consequently, the latch-enable times are reduced to 1 to 2 nsec. Because the SRAMs match the timing requirements of Intel's 82385 controller, they have read and write cycle times as low as 25 nsec. The 25-nsec latch-enable/RAM-access time yields an adequate margin for a 33-MHz design. Micron Technologies' MT56C0816 and Quality Semiconductor's QS88xx SRAMs contain on-chip transparent address latches optimized for use with the 82385 cache controller and the 80386 μP. Both CMOS families of SRAMs have members that can work with 25-, 33-, and 40-MHz designs.

You can organize the memory cells for these CMOS
Vendors are incorporating glue logic and system functions into SRAMs to speed and streamline throughput between µPs and memory subsystems. (Photo courtesy Integrated Device Technology Inc)
Standard 16- and 20-MHz-style designs that employ traditional SRAMs and external glue logic cause interface problems at higher frequencies.

SRAMs as two, 2-way set-associative blocks of 4k x 16-bit or one direct-mapped 8k x 16-bit block. The memory arrays in two versions of the Q588xx family can accommodate a CPU parity bit. The MT56C0816 has two independent output-enable pins that tie to the COEA and COEB pins on the 82385. The output-enable time is 8 nsec—sufficient time to select the data from the correct associative block in a 33-MHz design.

Intel's 82395DX smart cache controller not only integrates address latches along with the data SRAM, the single chip includes the tag RAM and the cache-management logic. The complete first-level cache sub-system ties directly to the local address, data, and control buses on the 80386 µP. The chip has either 16, 32, or 64k bytes of data SRAM organized into 4-way set-associative blocks. The chip is available for 20-, 25-, and 33-MHz designs. Intel also offers the 82395SX smart cache controller with 8k bytes of data SRAM that ties directly to the 80386SX µP.

Some µPs, such as Motorola's 68030 and 68040, can

communicate with external memory synchronously. Synchronous communication requires the µP to maintain valid bits on the address, data, and control buses during the rising edge of the system clock. System designs for 16- to 20-MHz operation employ 374-type D flip-flops to store bits on the local buses using the system clock. For synchronous 33-MHz and faster frequency designs, SRAM vendors have moved 374-type D flip-flop registers onto the RAM chip. These synchronous SRAMs use the system clock to store the address and control inputs in the on-chip registers. Synchronous storage permits the µP to communicate with the SRAM in a pipelined mode. For example, during a burst fill, the SRAM stores the N+1th address, chip select, and write-enable lines on a system-clock edge while returning the Nth data word to the µP on the same clock edge.

By synchronously storing the address, chip select, and write-enable lines on-chip, the synchronous SRAM also can generate the write pulse to the RAM array.

For synchronous 33-MHz and faster frequency designs, SRAM vendors move 374-type D flip-flop registers onto the RAM chip.

onboard the chip—a technique known as “self-timed write.” An on-chip register has more controlled write-pulse setup time (measured from the rising clock edge to the falling write-pulse edge) and write-pulse hold time (measured from the rising edge of the write pulse to the next rising clock edge) than an off-chip register (Fig 1). Therefore, SRAM designers can generate a wider on-chip write pulse and thereby employ a slower, less expensive RAM array to achieve the system write-cycle time.

Micron Technologies’ MT58C1616 and Motorola’s MCM62990 SRAMs have typical synchronous SRAM architectures. Besides their synchronous registers and self-timing features, these devices have asynchronous input-data latches that simplify timing during write cycles. They also have dual write-enable lines that permit individual byte writes. Dual chip-select lines, which eliminate the need for chip-select decoders when using the SRAMs in a dual-bank arrangement, are another feature of both chips.

Both CMOS chips have an option for either 5V or 3.3V power supplies for the output buffers; therefore, they are compatible with future high-speed μPs that may use 3.3V power supplies. Micron also offers their cache data SRAMs in a 53-pin plastic quad flat pack (PQFP) that is 40% smaller than industry-standard 52-pin plastic leadless chip carriers. The PQFP has an outside dimension of 14.3 mm. The smaller footprint not only occupies a smaller board space, it also reduces board trace lengths, cutting time delays and crosstalk.

On-chip cache avoids bottlenecks

When a μP sequentially reads and writes data to an external memory device, the μP runs into a fundamental limitation known as the “Von Neumann bottleneck.” No matter how fast the μP can clock data internally, the rate at which information can be piped in and out of external memory limits the chip’s processing speed. Therefore, recent μPs place a complete first-level cache subsystem on the processor chip to profit from on-chip parallel processing. Motorola’s 68040 integrates independent 4k-byte instruction and cache data SRAMs, independent memory management units (MMU) and cache controllers, a bus controller, and an execution unit on a single chip. Intel’s i486 integrates an 8k-byte cache SRAM for storing code and instructions, a cache controller, an MMU, a bus controller, and an execution unit.

Although the densities of the cache RAMs in both the 68040 and i486 are sufficient to achieve better than 90% hit rates, occasionally a miss occurs and the cache controller must fetch the data from an external secondary cache. Both of these μPs have burst modes for accessing a line from external memory. During a burst line refill or push, the first access requires two clock cycles. Succeeding accesses require one clock cycle. Burst SRAMs assist the system designer in designing a secondary cache subsystem to handle the one-clockcycle access timing constraints in a high-speed design.

Motorola’s MCM62940 32k × 9-bit synchronous burst SRAM is designed as a secondary cache to handle the 68040’s burst mode. The 68040 can initiate a 16-byte line refill or push to the secondary cache using a single instruction—MOVE16. The burst SRAM integrates synchronous registers, which store address and control signals using the system clock, and an on-chip, 2-bit binary counter, which operates similar to the address counter in nibble-mode dynamic RAMs (DRAMs). The burst counter imitates the burst address sequence from the μP, but only stores every fourth address in the sequence. The binary counter generates the intervening addresses. Because the chip internally generates successive addresses to the array, the architecture eases external timing constraints. The 62940’s 9-bit organization accommodates the 68040’s parity bits.

Intel’s i486 also initiates a burst mode to refill or push a 16-byte line to an external secondary cache whenever there is a miss in its on-chip internal cache.
Motorola's MCM62486 32k x 9-bit and Quality Semiconductor's QS881 8k x 18-bit burst RAMs contain 2-bit counters that imitate four successive addresses in the burst sequence of the i486 to alleviate off-chip timing burdens. Both devices operate in 33- and 40-MHz designs, and their 9-bit organization accommodates the parity bits of the i486.

Mosel's Simulcache is a chip set for use as a secondary cache in a 33-MHz i486 design. The set consists of the MS441 cache controller and the MS443 intelligent dual-port SRAMs. By providing dual-port access, the MS443 isolates the µP from the system data bus. The dual-port SRAM provides 8-nsec, simultaneous access to the CPU and the main memory during burst reads and writes. In addition, the 16k x 9-bit SRAM has an internal 128-bit data path that permits the chip to move large chunks of data into, out of, and around the memory quickly. Therefore, the chip can absorb transactions from the main memory and reorder the data to meet the needs of the CPU.

Multiports assist multiprocessors

Architectural developments in high-speed, dual-port SRAMs allow two CPUs to communicate with each other by passing data through a common memory. The basic dual-port architecture is a variation on the traditional single-port SRAM, which has one read and write control circuit for a single address and data bus. The dual-port memory has two sets of address, data, and read/write control signals, each of which access a single on-chip memory array. Each set of controls can independently and simultaneously access any word in the array, even when both ports are accessing the same location at the same time.

Multitasking processors must signal each other when requesting a task or indicating a task's completion. Interrupts are a common signaling mechanism. IDT's 25-nsec IDT71321 is a dual-port SRAM containing logic that allows one CPU to interrupt the other. A CPU simply writes to a specific address port to activate the interrupt to the other CPU. The IDT71322 dual-port SRAM contains semaphore logic that provides a set

SRAM architectures are married to the design of a specific processor. Motorola's MCM56824 is an 8k x 24-bit SRAM that has dual chip enables and output enables that conform to the time requirements of the DSP56001 DSP chip.
Special-feature SRAMs

of flags that software can use to allocate blocks of memory for one of the CPUs to use.

You use each flag to indicate which CPU has permission to use a specified block. You can set each semaphore flag to either CPU, but not to both. IDT also offers 4-port SRAMs, which let four CPUs share a common memory for multiprocessing or parallel processing. The IDT7052 4-port SRAM has independent address, data, and read/write control ports, all of which have independent access to the chip's internal memory array. The 4-port structure facilitates hypercube and cluster configurations.

Architectural enhancements to SRAMs in the CMOS families are paving the path for memory systems operating as fast as 50 MHz. But CPUs aren't obeying any 50-MHz speed limit. Vendors are obtaining licenses for implementing some popular CPU architectures, such as the MIPS 3000, using GaAs to send CPUs rocketing ahead. These CPUs have ECL-compatible I/Os and will operate in the 60- to 100-MHz range. Some SRAM vendors are on top of the situation and plan to offer BiCMOS SRAMs that will have ECL I/Os and be able to interface with these CPUs.

Cypress has acquired the rights to manufacture National Semiconductor's 2k x 9-bit and 8k x 9-bit ECL SRAMs using a 0.8-µm BiCMOS process. The 6-nsec CY100E492 is a synchronous, self-timed SRAM that employs on-chip registers on its input and output lines. A single clock stores the data in the input registers, and the output registers are self timed. The chip produces a flag for checking the parity of both the address and the data. A hidden write-cycle mode simplifies

Fast access dual-port SRAMs permit two CPUs to communicate through a shared memory in multiprocessor applications. The IDT7130 dual-port SRAM contains interrupt logic that permits one CPU to inform another CPU of task assignments.

Modifications to the traditional SRAM architecture (a) simplify interfaces. Quality Semiconductor's QS8816 cache data SRAM (b) for 80386 systems has transparent address latches, dual chip selects to eliminate bank decoders, separate write enables for each memory bank, and dual 8-nsec output enables for gating data onto the bus.
Over 2500 Standard Models Add Up to Your Power System Solution

Over 2500 standard models add up to a lot of flexibility. Whatever your requirements...input voltage, output voltages, power levels or temperature...odds are that Vicor has your solution.

Our component-level power solutions feature high efficiency and low-noise FM control, in small standard packages, at prices that won't break your budget. Give us a call...let us show you how quickly and easily power components add up to your total power system solution.

Special-feature SRAMs

interleaving write and read cycles by maintaining active output data for a previous read cycle during a subsequent write cycle. Samples of this device are available with 100K and 101K family ECL-compatible I/Os.

Silicon Connections Corp also will offer an 8k×9-bit synchronous, self-timed SRAM having ECL I/O. The 5-nsec SC4109 is specifically designed as a cache tag RAM. The BICMOS RAM contains a comparator with a 1.5-nsec propagation delay to perform the tag-address "match" function. The chip produces three flags for checking parity errors on input address data and output data. The chip also has a flash-clear pin that lets the system clear the "valid bits" in 50 nsec. The company will also offer the 256k×4-bit SC5204 and the 1M×1-bit SC5200 asynchronous SRAMs, which have 10-nsec access times. These BiCMOS devices have 100K family ECL-compatible I/Os.

SRAM features are not just bells and whistles

The complete list of features that vendors are incorporating into the basic SRAM architecture to improve system performance is too long for a single article. The list should include IDT's SyncFIFO and Cypress' CYC451, both of which use a clock to load data into and out of FIFO memory (similar to synchronous SRAMs), and AMD's Am99C10A content-addressable memory, which can match a source and destination address in a LAN bridge within 70 nsec. Although the feature list is long, these enhancements are not just bells and whistles added to fast-access memories. In many cases these architectural innovations are the only way to make a high-speed memory system work.

Manufacturers of special-feature SRAMs

For more information on the special-feature SRAMs such as those described in this article, circle the appropriate numbers on the Information Retrieval Service card or use EDN's Express Request service. When you contact any of the following manufacturers directly, please let them know you saw their products in EDN.
If someone said you could fab a chip in your facility with one million transistors, a clock rate of 100MHz, very low power consumption, on silicon, dissipating less than three watts of heat, you’d probably say, “No way.”

You’d be wrong.

Everything we said in the first paragraph is true. Thunderbird Technologies has developed and patented a system of design tools and philosophy we call TDP™ which optimizes the speed and power available from your process. Plus, we have Fermi-FET® a revolutionary device architecture that dramatically reduces the capacitances of your design logic. The combination is a quantum breakthrough in high speed/low power semiconductor design and device technology.

We can have your designs manufactured or, we can convert your fab to the enhanced benefits of next generation chip technology – in less than six months. Our customers will realize a substantial competitive edge over system designs using more expensive and exotic materials, like gallium arsenide and BiCMOS.

Think about it… Silicon chips, breakneck speeds, very low power consumption, no meltdown, in your fab.

Then give us a call. 919-481-3239

1000 Perimeter Park Drive • Research Triangle Park, NC 27709-3739

Thunderbird Technologies, Inc.
Keeping you a generation ahead
Now there's a way to get FDDI systems to do what they're supposed to do. Run wide open, lightning fast and bottleneck free.

Introducing the Motorola FDDI chip set. The complete system solution in a 4-chip, fully ANSI-compliant design.

Led by the FDDI System Interface chip, it speeds data through the system at up to 200 Mbytes/second via two 32-bit ports. While 8 Kbytes of on-chip RAM provide more than 80 microseconds of bus latency. Freeing up your host for other system tasks.

Its partners are the FDDI Clock Generator, the Elasticity Buffer and Link Manager, and the Media Access Controller. Together, they handle all FDDI functions quickly and efficiently, without the hassle or expense of external memory or high-speed logic.

Not only is the Motorola FDDI chip set ideal for FDDI-networked systems, it's perfect in routers, bridges and concentrators.

And our partnership with Digital Equipment Corporation helps us ensure its compatibility with the FDDI protocol.

So you can stop waiting for the signal that FDDI has truly arrived. Because the Motorola FDDI chip set is here today. For more information and a free poster, call 1-800-845-MOTO.
It's no bigger than this ad (6U VMEbus to be exact). It doesn't suck power like less efficient controllers. It's RISC-based for super performance. It connects single or dual attached stations from a single VME slot. It supports a variety of media, from fiber to twisted pair. It's ANSI X3T9 FDDI standard compliant. It's certified by the Advanced Networking Test Center™ and the University of New Hampshire Interoperability Lab (Interphase is a charter member of both).

IT'S AVAILABLE...RIGHT NOW.

The Interphase V/FDDI 4211 Peregrine is at work right now in some of the industry's leading open systems networks. Put Interphase high performance expertise to work for you.

Call or FAX us today for information about Interphase FDDI solutions, including VME and Multibus controllers, the new fiberHUB FDDI Concentrator and the FDDI System Designer's Kit. We've also got proven Ethernet and Token-Ring products to tell you about.

TEXAS INSTRUMENTS

A PERSPECTIVE ON DESIGN ISSUES:
Breaking the analog barriers to optimum system design

IN THE ERA OF
MegaChip TECHNOLOGIES
Advanced Linear extends the boundaries of system performance.

Innovative analog circuits from Texas Instruments add a new edge to Digital Equipment’s proven market winners. They can do the same for you.

The goal Digital Equipment Corporation set was clear: Strengthen its position as the leading supplier of Ethernet-based local area network products. Achieving the goal has been spurred by the use of Advanced Linear circuits from Texas Instruments.

These leadership ICs meet growing industry demand for linear circuits that can improve overall system performance and reliability, reduce costs and speed design cycles.

These were precisely the advantages Digital's designers needed.

Expertise and teamwork carry the day
For many years, Digital has used a wide variety of TI linear circuits — from op amps to mixed-signal devices — and values our analog viewpoint toward system design.

As Digital defined the requirements to meet its market goal, the decades-long relationship entered a new era of even more intense cooperation. With Digital handling system-level design and TI applying its linear expertise, the two teams fully utilized our LinASIC™ design methodology to create a series of mixed-signal EtherCell™ functions. They are the basis for the advanced linear devices Digital requires.

The design flow was aided by our Boston-area Regional Technology Center that provides access to LinASIC development tools and by the extensive use of EDIF to exchange information.

Enhancing Digital’s competitive edge
To date, close teamwork has produced components that can enhance Digital's ability to respond quickly to market demands for feature-rich but lower cost Ethernet and communications products:

• A dual driver and dual receiver IC that minimizes the number of components required for the Attachment Unit Interface (AUI) function in an Ethernet network.
IN THE ERA OF MEGACHIP™ TECHNOLOGIES

"Utilizing TI's LinASIC mixed-signal design methodology allows us to design cost-effective solutions with aggressive time-to-market goals."

— Nick Ilyadis, Product Engineer
Telecommunications and Networks Group
Digital Equipment Corporation

- An octal receiver created to solve system-level cross-talk noise problems in RS-232, -485 and -423 applications. This full-custom device, fabricated in TI's Advanced LinCMOS™ process, is designed to meet EIA and CCITT specs.

- A device that will be a complete AUI multiport concentrator on a chip. Fabricated in our LinBiCMOS™ process, it will replace a 6-inch by 12-inch circuit board that incorporates nine discrete ports, logic devices and analog circuitry. The new device will tie any combination of as many as eight units into Ethernet.

- A single-channel 10BASE-T twisted pair interface chip that includes internal precompensation and full duplex operation. Also fabricated in our LinBiCMOS process, this IC cuts component count and improves data transmission.

The Ethercell devices developed by Digital and TI will be incorporated into our existing LinASIC cell library.

Extensive mixed-signal capabilities

As Digital recognizes, few in the industry can match our experience in analog design and digital design. This expertise enables us to effectively combine high-performance analog functions with leadership digital functions. The resulting mixed-signal devices typify our capabilities to design and develop the Advanced Linear circuits our customers need.

Let us help you meet your challenge

We are ready to provide information and assistance, as well as access to the hardware and software development tools you need, to help extend the boundaries of your system performance.

Our service circles the globe, and our worldwide manufacturing capability can support your production schedules wherever you are.
A PERSPECTIVE ON ANALOG SYSTEM DESIGN

TI's analog viewpoint: From process technologies come Advanced Linear ICs.

TI's LinASIC mixed-signal methodology —
A cell-based design methodology allowing the combination of high-performance analog and digital functions on the same chip. This mixed-signal capability is used for many of our catalog products and for custom/semicustom solutions. It is supported by large cell libraries, design-automation tools and these TI Advanced Linear wafer process technologies:

LinBiCMOS — Combines Advanced LinCMOS, digital ASIC CMOS and up to 30-V bipolar technologies to allow the integration of digital and analog standard cells and handcrafted analog components on a monolithic chip.

LinEPIC™ — One-micron CMOS double-level metal, double-level polysilicon technology that adds highly integrated, high-speed analog to the high-performance digital EPIC™ process.

Advanced LinCMOS — An N-well, silicon-gate, double-level polysilicon process featuring improved resistor and capacitor structures and having three-micron minimum feature sizes.

Power BIDFET™ — Merges standard linear bipolar, CMOS and DMOS processes and allows integration of digital control circuitry and high-power outputs on one chip. Primarily used for circuits handling more than 100 V at currents up to 10 A.

Multi-EPI Bipolar — A very cost-effective technology that utilizes multiple epitaxial layers instead of multiple diffusion steps to reduce mask steps by more than 30%. Used to produce intelligent power devices that can handle loads as high as 20 A and voltages in excess of 100 V.

Excalibur — A true, single-level poly, single-level metal, junction-isolated, complementary bipolar process developed for high-speed, high-precision analog circuits providing stable op amp performance.

For more information on our Advanced Linear process technologies and the products they are producing, call 1-800-336-5236, ext. 3425.

TI's LinASIC methodology and Advanced Linear process technologies are enhancing these product families:

Data Transmission — This family meets the needs of most industry-standard interfaces (EIA, IEEE, ANSI) and ranges from drivers/receivers/transceivers to fully integrated controller/transceivers.

Data Acquisition — The family ranges from stand-alone A/Ds and D/As to complete data conversion subsystems on a chip; from general-purpose functions to highly integrated digital signal processor and graphics signal processor analog interface circuits. Other specialized family members include telecom and speech synthesis functions.

Intelligent Power — These devices combine high-voltage and/or high-current switches with the analog and digital circuitry required to perform interface, control, protection and diagnostic functions in microcontroller-based systems.

Operational Amplifiers — A family of op amps and comparators ranging from standard bipolar to leadership high-performance CMOS and Excalibur complementary-bipolar devices, meeting needs ranging from low power and/or low noise to high speed and/or high precision.

Custom/semicustom Functions — In modifying existing products to fit your needs or in defining your own unique functions, our LinASIC methodology allows access to existing analog cells used in the development of our catalog products and compatibility with our digital cell libraries.
Build a single-shot recorder to catch fast transients

Capturing fast transients places special requirements on filters, track/hold amplifiers, and A/D converters. By using an A/D converter with a high input bandwidth and oversampling at a 10:1 ratio, you can digitize and then analyze transients without using an expensive analog or digital storage scope.

Ken Deevy, Dan Sheehan, and Mike Byrne, Analog Devices Inc

Don't tie up expensive equipment trying to capture transients that occur infrequently. If you build a low-cost transient recorder or event sampler, you can dedicate it to capturing single-shot events. Typical applications for transient recorders include monitoring power mains transients, evaluating power supplies, and capturing pressure and vacuum-line transients in medical equipment.

To build a transient recorder or burst-mode event sampler, you need a high-speed A/D converter, a wideband track/hold amplifier, and an antialiasing filter. The A/D converter must have a sampling rate of at least twice the bandwidth to satisfy the Nyquist criterion. In practice, you should oversample the input signal. At $2 \times$ oversampling (a sampling frequency of twice the input bandwidth), you'll need to use a filter with an infinite roll-off rate to avoid aliasing effects. At $3 \times$ oversampling, the roll-off requirement drops to 50 dB/octave in an 8-bit system. With an oversampling ratio of 10:1, the filter roll-off need be only about 16 dB/octave. (See box, “Oversampling reduces antialiasing requirements.”)

High-speed sampling A/D converter chips routinely include track/hold amplifiers on the same chip. The AD7821 is an example of this trend. It combines a 100-kHz track/hold amplifier with a 100-sample/sec 8-bit A/D converter. Because the A/D conversion rate is 10 times the input bandwidth, you don't have to design a complex antialiasing filter. In fact, if the input signal exhibits only a low-power spectral content at and above 500 kHz, you can eliminate the filter altogether.

The AD7821 uses a half-flash conversion technique to perform an 8-bit conversion in 660 nsec. A requirement of a 350-nsec signal-acquisition period between conversions results in a maximum acquisition rate of 1M samples/sec. You can operate the A/D converter with a single or dual supply for either unipolar or bipolar inputs.

Capture single-shot waveforms

One of the difficulties in capturing single-shot events is the speed at which the transient recorder circuit responds once the input signal has crossed a predetermined trigger point. If the recorder circuit responds too slowly, it can miss fast transients altogether.
To build a transient recorder or burst-mode event sampler you need a high-speed A/D converter, a wideband track/hold amplifier, and an antialiasing filter.

Therefore, to accurately capture fast events, you need a high-speed A/D converter and a wide-bandwidth track/hold amplifier. For example, an 8-bit A/D converter that has a 1-µsec conversion time can capture 1-µsec transients only if it's not preceded by a track/hold amplifier. If you match this A/D converter with a track/hold amplifier that has a 100-kHz bandwidth, the ADC can recover 6-µsec-wide 5V transients.

To simplify fault detection or take corrective measures, you need a transient recorder that can grab pretransient information. You can use this pretransient data to learn timing relationships between the transient and another waveform. Additionally, your recorder should be able to react to both positive and negative transients.

Another important criterion for transient recorders is cost. Although you could use a digital storage oscilloscope (DSO) to capture frequently occurring or very fast transients, dedicating a DSO to capturing random events would be an expensive proposition.

**Transient recorder**

A block diagram of a transient recorder (Fig 1) shows the minimum hardware you'll need to build a high-speed transient recorder with playback. For sim-

---

**Oversampling reduces antialiasing requirements**

In the spectrum of a periodically sampled waveform, the spectrum of the (unsampled) input-signal repeats around harmonics of the sampling frequency. Any frequency contained in the input signal is repeated above and below each harmonic of the sampling frequency. Therefore, in the spectrum of the sampled signal, the band between 0 and f\textsubscript{IN} (the input spectrum), appears—among other places—between f\textsubscript{S} - f\textsubscript{IN} and f\textsubscript{S}, where f\textsubscript{S} is the sampling frequency. Though you may be under the impression that the input-signal bandwidth is 100 kHz, if the sampling frequency is 1M sample/sec, a signal at 991 kHz in the input spectrum would appear as a 9-kHz “alias” component in the sampled signal's spectrum.

The purpose of an antialiasing filter is to remove or at least attenuate any noise or spurious signals that could be aliased back into the bandwidth of interest. Fig A shows the frequency response of an antialiasing filter for a generalized A/D converter. You determine the filter roll-off by drawing a straight line between the highest signal frequency of interest, f\textsubscript{IN}, and the stopband attenuation frequency, f\textsubscript{S} - f\textsubscript{IN}. As the ratio of f\textsubscript{S} to f\textsubscript{IN} increases (that is, as the oversampling ratio increases) the slope of the line decreases.

In an 8-bit system, an ideal ADC's signal-to-noise ratio (S/N) is slightly greater than 256:1 or 48 dB. To avoid having noise limit the system performance, the ratio of the input signal to noise should exceed the approximately 48-dB limit imposed by the ADC. Here, the signal is the peak-to-peak value of the signal within

---

**Fig A**—The antialiasing filter that precedes the transient recorder's ADC can be simple or complex depending on the degree of oversampling. When the sampling frequency is 10x the highest frequency of interest, the filter has 3 octaves to roll in its attenuation. A simple 3-pole filter has 18 dB/octave roll-off. An 8-bit ADC needs slightly more than 48 dB of attenuation. Hence, a 3-pole filter is usually sufficient for 8-bit resolution.
plicity, the design uses a clock with an even mark/space ratio. The clock’s 50% duty cycle limits the acquisition rate to 660k samples/sec rather than the A/D converter’s 1-M sample/sec maximum rate. (This simplification reduces the oversampling ratio to 6.6:1.) A memory chip stores the digitized data for later playback on an X-Y plotter or oscilloscope via a dual 12-bit D/A converter and a quad op-amp. One half of the samples are pretransient information; the other half are transient data.

A more detailed schematic (Fig 2) shows that two counters, IC1 and IC2, control where the circuit stores pretransient and transient data. The counters also

The band of interest, and the noise is the square root of the sum of the squares of the amplitudes of all of the frequency components outside that band. The attenuation required on signals outside the band of interest depends on the application and the expected magnitude of the out-of-band signals. In most cases, the magnitude of these signals is much lower than that of the desired signal.

Usually, 8-bit systems require 50 dB of attenuation for signals that can be aliased into the band of interest. Even if 50 dB is not the desired number, the following calculations show the kind of reduction in antialiasing filter requirements brought about by oversampling. With \( 2 \times \) oversampling, (that is with \( f_s = 2 \cdot f_N \), \( f_s \) and \( f_N \) are at the same point and the filter has to have infinite roll-off to attenuate signals at \( f_s - f_N \). With \( f_s = 3 \cdot f_N \) (3 \( \times \) oversampling), the filter’s attenuation must drop from 0 dB at \( f_N \) to 50 dB at 2\( f_N \). In other words, the slope of the attenuation vs frequency curve must be 50 dB/ octave; the filter (if it has a Butterworth characteristic) must have more than eight poles.

With \( 10 \times \) oversampling, there are three octaves for the attenuation to drop from 0 to 50 dB. The required slope is a little more than 16 dB/octave; a 3-pole Butterworth filter will do the job.

The above analysis of the antialiasing filter holds true regardless of the type of ADC that follows the filter. No matter what the conversion technique, oversampling reduces the antialiasing filter requirements. Oversampling also reduces the ADC noise within the signal bandwidth because it spreads the quantization noise over a wider bandwidth. Oversampling has recently gained considerable popularity in connection with sigma-delta ADCs. In the case of these converters, the advantages of oversampling are much greater than with successive-approximation or flash ADCs because noise shaping produces dramatic improvements in noise performance as the oversampling ratio increases.

The relationship between antialiasing-filter performance and oversampling is, however, exactly the same for an oversampled sigma-delta modulator as for a half-flash or a successive-approximation ADC. A sigma-delta ADC and a half-flash ADC with the same oversampling ratio place the same requirements on the antialiasing filter.

The disadvantage of the sigma-delta process for transient recording is the pipelining or averaging technique inherent in sigma-delta converters. Because of the pipelining, a step change requires a significant time (the settling time of the ADC’s digital filter) to ripple through to the output. Therefore, there is a delay before a sigma-delta converter produces an output that represents an input change. Between the time the input changes and the sigma-delta converter’s output reflects the change, the ADC’s output does not accurately represent the converter’s input. Such performance is not appropriate for transient recorders of the type discussed here.

To avoid aliasing effects, at $2 \times$ oversampling (a sampling frequency of twice the input bandwidth) you need a filter with an infinite roll-off rate.

clock out data to either the oscilloscope or the X-Y plotter. You can use the fast clock input, CLK IN1, for the clock source when you’re using the circuit in the record mode or displaying stored data on an oscilloscope. The design also provides a slower clock input, CLK IN2, to print data on an X-Y plotter.

The transient recorder operates in two basic modes: record and playback. You select the record mode by placing switch $S_1$ in the record position. (IC$_{18A}$ and IC$_{18B}$ provide debouncing for this switch.) Having the MODE output of IC$_{13D}$ low makes one input of both IC$_{13A}$ and IC$_{14D}$ low. Hence the clock inputs of IC$_{1A}$ and IC$_{9B}$ (pins 10 and 2, respectively) are disabled, ensuring that the 1Q and 2Q outputs of IC$_{1A}$ and IC$_{9B}$ are high. Besides disabling the chip-select inputs of the D/A converter, CSA and CSB, the circuit disables the output-

---

**Fig 2—At the component level, the basic transient recorder is a circuit of moderate complexity, requiring 23 ICs.**

EDN June 20, 1991
enable signals of IC3, IC4, and IC5 (the HM6264 memory chip), ensuring that the playback portion of the transient recorder is turned off.

CLK IN1 serves as the clock source for the counters via IC14C, IC13B, IC15B, and IC16C. While the MODE signal is low, CLK is the clock input for both counters and provides the RD (convert) signal for the A/D converter, IC6. At the same time, IC6's CS input is active, ensuring that the device is selected. After a reset from S3 initializes the circuit, counter 2 begins counting. IC17 and IC238 hold the reset (CLR) input of counter 1 high from power-up and keep counter 1 in a reset condition until the circuit detects a transient.

You configure the A/D converter by tying its MODE input (pin 7) to GND. (Note that the MODE pin of the AD7821 shown bears no relation to the signal labeled
With an oversampling ratio of 10:1, the filter roll-off need be only about 16 dB/octave.

MODE in the circuit diagram.) When the CLK signal toggles its RD input, the A/D converter executes continuous conversions of the input signal, \( V_{IN} \). Counter 2 provides the memory addresses for the A/D conversion results. Data transfers from the digital outputs of IC\(_6\) to IC\(_5\) employ the IN\(^T\) output of IC\(_6\) to drive the WE input of IC\(_5\).

The circuit automatically loads the first conversion result after reset into location 0 of memory and the second result into location 1. After transferring the result of the 4096th conversion to memory location 4095, the counter resets and stores the next conversion result in location 0. The memory will therefore always contain the most recent 4096 samples of the input waveform.

Detect fast transients

You apply the input signal to \( V_{IN} \). This terminal connects directly to two TL311 comparators and the analog input of the A/D converter. Comparator IC\(_{19}\) detects positive transients, and IC\(_{20}\) detects negative ones. To set the threshold level for a positive-going signal, adjust resistor R\(_5\); adjust R\(_6\) for negative-going transients. Wire the outputs of both comparators together to ensure that they produce a rising edge to the clock input of IC\(_5\) when either a negative or a positive transient occurs.

Once the circuit detects a rising edge at pin 11 of IC\(_5\), it illuminates an LED, D\(_1\). At the same time, it releases counter 1 from its reset condition by taking RS\(_1\) low. Now the circuit clocks both counter 1 and counter 2 as A/D conversions continue. Counter 2 counts up from the value it held before the transient was detected. The memory locations determined by the output of counter 2 store the transient data while overwriting the oldest 2048 samples of pretransient data already stored in memory. Counter 1 counts off the 2048 clock states that correspond with the samples.

Because the output of IC\(_{16}\) is always high in the record mode, when counter 1 reaches 2047, all inputs to IC\(_{10}\) and IC\(_{11}\) are high and both IC\(_{5}\)'s outputs go low. As a result, the output of IC\(_{12}\) goes high, causing the output of IC\(_{14A}\) to go low via IC\(_{13A}\) and IC\(_{12B}\). This DIS REC CLK signal gates off CLK IN\(_1\) from the rest of the circuit at IC\(_{14B}\). The output of IC\(_{13C}\) ensures that the CLK signal is held low, stopping both counters and the A/D converter.

At the end of the transient-record cycle, the memory will contain 4096 samples of the input waveform. One half of these samples are transient data, the other half represent pretransient information. Whatever value is in counter 2 will be the last memory location for the transient data. The next memory location will hold the first of the 2048 words of pretransient data. Now when you start the playback mode, the first output from the counter will correspond to the memory location of the first pretransient sample. (To alter the ratio of transient to pretransient samples, simply alter the connections from counter 1 to IC\(_{10}\) and IC\(_{11}\).)

To accurately convert the input waveform to stored data, you must pay close attention to the circuit. Use a precision reference, IC\(_{21}\), to generate 5V and -5V references for the V\(_{REF+}\) and V\(_{REF-}\) inputs of the A/D converter. Make sure that you properly decouple these reference voltages along with the V\(_{DD}\) and V\(_{SS}\) lines of the A/D converter. Connect IC\(_{5}\)'s GND pin to the star ground of the system (the point in the circuit at which you connect the analog and digital grounds). Make sure that the conductor between the A/D converter and the star ground is as wide as circuit-board layout constraints allow. Further, ensure that the WR/ RDY line is pulled high via R\(_{19}\) to avoid noise pickup on this pin.

Play back captured signals

Once you've captured that bothersome transient, you can play it back at any convenient time; the recorder will retain the information as long the power remains on, or until you depress the reset button. Select the playback mode with S\(_1\). Playback takes the MODE signal low, activates the WR input to IC\(_5\), and deselects IC\(_5\) by taking its CS high. You can display the transient on either an analog oscilloscope or an X-Y plotter, depending on the position of S\(_2\). Make sure to select the oscilloscope or the plotter before starting playback.

If you decide to display the transient on an oscilloscope, the clock source for the circuit is the same as in the record mode. If you use a plotter for playback, the clock frequency is much lower and is applied via the CLK IN\(_2\) input. CLK (from either CLK IN\(_1\) or CLK IN\(_2\)) passes through gates IC\(_{13D}\) and IC\(_{14D}\) because the MODE signal is high. IC\(_{3A}\) and IC\(_{3B}\) generate the CSA and CSB pulses for IC\(_{7}\) from this CLK signal.

IC\(_{3A}\) drives the CSA input of IC\(_{7}\) as well as the enable signals for IC\(_{5}\) and IC\(_{5}\). When you choose the playback mode, counter 1 resets and starts counting from 0 to 4095. The counter's output is the digital input code to DAC A of IC\(_{7}\). This DAC drives the X axis of either the oscilloscope or the plotter. DAC A produces
a unipolar output range from 0 to 5V, with a resolution of 4096 steps.

The output of IC9B drives the CSB input of IC7 and also sets the logic level on IC5's output-enable line, OE. This action latches the data from memory into DAC B, which drives the Y axis of the oscilloscope or plotter. By using dual supplies, you can set DAC B for a bipolar output range to reconstruct both positive and negative transients.

Counter 2 starts its count from the point at which it stopped at the end of the record mode; the first memory output word to IC7 is the oldest sample in memory. The scan will then proceed through the 2048 samples of pretransient information and the 2048 samples of transient information. The output of each sample from memory to the Y axis, via DAC B, corresponds to the output of a count value from counter 1 to the X axis via DAC A. In this way, the circuit reconstructs the pretransient and transient waveforms.

For oscilloscope display of waveforms, place S2 in the scope position. Doing so locks out CLK IN2 from the rest of the circuit but allows CLK IN1 to operate as clock signal for the circuit. Unlike the plotter display option, where counter 1 runs through once and then stops, CLK runs continuously. CNT FIN goes high when counter 1 reaches a count of 4095, but because the output of IC14C is high, the DIS PLOT CLK signal does not go low. You can see the typical oscilloscope waveform display in Fig 3(a).

You display the stored waveform on an X-Y plotter by placing S2 in the plotter position. Doing so locks out the CLK IN1 input from the rest of the circuit and permits CLK IN2 to generate the clock signal for the circuit. IC16B, IC19, IC11, and IC12A function in a manner similar to the record mode to generate a high CNT FIN signal. But this time, IC10 and IC11 go low when counter 1 reaches a count of 4095. IC12A goes low, and, because the output of IC14C is already low, the DIS PLOT CLK signal goes low, turning off CLK IN2 at IC18C and holding the CLK signal high. Fig 3(b) shows a captured transient displayed using a plotter as the display method.

**Record-mode timing and clock waveforms**

The timing diagrams in Fig 4 show the logic relationships for the record mode. The MODE signal (not shown) is low and the DIS REC CLK signal is high. The RS2 signal goes high when the recorder receives a reset command via S3 resetting counter 2. The next falling edge of the CLK signal clocks out an address for IC5 from counter 2. A conversion is also initiated on this falling CLK edge, and, within 700 nsec, the INT signal of IC6 goes low, activating the WE input of IC5. The rising edge of CLK resets the INT line 50 nsec later.

When the circuit detects a transient, the TRANS REC signal goes high, causing the RS1 line to go low and releasing counter 1 from its reset state. The next falling edge of CLK clocks out the outputs from counter 1. When the count output from counter 1 reaches 2047, the CNT FIN signal goes high and causes the DIS REC CLK signal to go low, shutting off the CLK signal.
To accurately capture fast events, you need a high-speed A/D converter and a wide-bandwidth track/hold amplifier.

In the record mode in the waveforms shown, the 50/50 mark/space ratio of the CLK signal limits the clock frequency to 660 kHz. You need a CLK-low time of 750 nsec for the A/D converter to perform its conversion correctly and latch the data into IC5. However, the CLK-high time can be as short as 350 nsec, the time required between conversions by the AD7821. Therefore, if the input to CLK IN1 has a low time of 750 nsec and a high time of 350 nsec, the circuit can make one conversion every 1100 nsec—equivalent to approximately 900k samples/sec.

**Playback to a scope**

During playback to an oscilloscope, (Fig 5(a)), the MODE signal, the WE input of IC5, and the DIS REC CLK signal are high. When you place S1 in the playback mode, RS1 goes high, resetting counter 1. The CLK signal generates a CSA signal for IC7 on its rising edge and a CSB signal on its falling edge. The falling edge of the CLK signal clocks data from counter 1, and the rising edge of CSA updates the X axis. The falling edge of OE outputs stored data from memory, and the rising edge of CSB updates the Y axis. The CLK signal runs continuously when the circuit is in the scope-playback mode.

The timing diagram of Fig 5(b) shows operation of the circuit for playback on a plotter. Once again, MODE, the WE input of IC5, and the DIS REC CLK signals are high. The circuit generates CSA and CSB to update the X and Y axes. Compared with scope playback, the difference in the circuit's operation is that when the output count from counter 1 reaches 4095 and the CNT FIN signal goes high, the DIS PLOT CLK signal goes low, forcing the CLK signal into a high state.

Burst-mode event sampling places requirements on an A/D converter similar to those for transient recording. In burst-mode sampling, the recorder looks at the input waveform infrequently, but when it does, it must acquire a large number of samples in a short time. With slower microprocessors or microcontrollers, you'll find that because of instruction- and bus-timing constraints, you can't achieve anything like the A/D converter's maximum throughput.

You can overcome timing limitations in a burst-mode sampler by using a DMA controller to initiate A/D conversions and transfer conversion data to memory. Doing so lets you run the A/D converter at or near its maximum sample rate, permitting high oversampling ratios and the acquisition of short transients.

Building a burst-mode sampler is a simple matter with the popular 8052 microcontroller (Fig 6).
though the 8052 does not support hardware DMA, it does support what is termed “fake DMA.” However, expect the response time to DMA requests to be much slower than what is possible with microcontrollers that support genuine DMA.

The HM6264P memory chip, IC₃, stores the control program for IC₁. The first part of the control program is the initialization routine. This routine (Listing 1) sets up the sense of the DACKO line of the 8237, IC₂, to be active high. It also loads the starting data address into IC₂ for the first conversion results. IC₁ initializes the counting register to control the number of conversions before IC₂ returns control to IC₁. The program must also set up IC₁ for “fake DMA.”

Once you’ve run the initialization program, IC₂ is ready to take control when requested to do so. Although IC₂ has four interrupt-request lines, this circuit uses only one, DREQ₀. An external command signal drives this interrupt line high, telling IC₂ to take control of the circuit and start the A/D converter sampling the input waveform.

After IC₂ receives the DREQ₀ request (Fig 7), its HRQ line goes high and feeds IC₁₄C, which takes the INT₀ line of IC₁ low. IC₁ responds to this “fake DMA” request by bringing its P1.6 line low and the output of IC₁₄A high, selecting inputs of IC₁₇, IC₈, and IC₉. When the output of IC₁₄A goes high, it shuts off IC₁’s address and data lines from the rest of the circuit and deselects the output’s address decoder, IC₁₃. The inverted P1.6 line also feeds the HLDA input of IC₂, acknowledging IC₂’s request for control. IC₂ then takes control of the address and data bus and the sampling of the input waveform.

To reduce pin count, IC₂ multiplexes the eight higher-order address bits on the data lines. You need an external device to latch these address bits. The address strobe signal, ADSTB, takes AEN high and switches the OC line of IC₄ low. ADSTB drives the C input of IC₆ to latch the higher address lines to the outputs of IC₆. The inverted AEN line also drives one input of IC₁₆P. The decoded output, Y₀, of IC₁₃ controls the other input of this gate. Therefore, either a high on AEN or a low on the decoder output selects IC₃. You need this control logic because both IC₂ and IC₁ must be able to access IC₃.

The DACK₀ line goes high at about the same time that ADSTB latches the address and drives one input of IC₁₆A. IC₁₆A and IC₁₆B ensure that the CS line of IC₄ goes low only when an input/output read operation of IC₄ occurs. IC₁₆C provides the correct polarity for the RD input and equals the delay paths for the CS and RD lines, ensuring that the circuit obeys the CS-to-RD setup time.

Once IC₄ receives a CS signal, it acknowledges receipt of the signal by bringing its RDY line low, placing the controller, IC₂, into a wait state for as long as its READY input is low. When the device completes a conversion, the RDY line goes high, releasing IC₂ from its wait state. Because IC₁’s RDY output is an open-drain output, you need to install an external pullup resistor, R₂.

When the circuit releases IC₂ from its wait state,
data from IC₄ is valid. The address lines of IC₄ determine where data loads into memory. IC₂ performs all of these operations automatically because a memory write accompanies each input/output read. Depending on the value loaded into the counting register, IC₂ will continue to issue read commands to IC₄ until the circuit completes the required number of conversions. IC₂ automatically increments the memory address after every write operation.

The multiplexer, IC₁₂, accommodates eight input
The three upper and three lowest address lines of IC2, gated through IC16A, IC16B, and IC16C, select the input channel. If the three upper address lines are set to all 1s, IC4 will convert each channel in sequence, and the conversion results will be stored in consecutive memory locations. For example, if the first conversion takes place on the channel-1 input voltage, \( V_{IN1} \), and the result is stored in location 5 of IC3, the next conversion will take place on \( V_{IN2} \), and the result will be stored in location 5 + 1. If the three uppermost address bits are set to 011, the circuit will sequence through channels 1 to 4 only.

**Ready or not**

The RDY line of IC4 drives the WR input of IC12, loading the address for the next channel to be converted into the multiplexer. When you have only one input channel to convert, you can use an alternate design: Remove IC16A, IC16B, and IC16C, and drive the A0, A1, and A2 inputs of IC12 directly from the three uppermost address lines. Using this scheme, the program chooses the input channel.

IC1 selects the device it talks to using a 1-of-8 address decoder, IC13. The outputs of IC13 provide signals for IC12's WR line, IC3's CS input, and IC2's CS input. One of the outputs also gates the P3.7 (RD) and the P3.6 (WR) outputs from IC1 to drive the IOW and IOR inputs of IC2. The upper three address lines of IC1 select the required device. The lower address lines are multiplexed with the data lines in a manner similar to the way IC3's address and data lines are multiplexed. IC11 demultiplexes the lower eight address lines. IC1's ALE signal latches these address lines. The 3-state buffers, IC7, IC8, and IC10, isolate IC1 outputs from the address bus when IC2 takes control. You must use these buffers because IC1 can't place its address and data buses into a high-impedance state when IC2 takes control of the circuit. IC9 also acts as a buffer but is bidirectional because IC1 must read data from and write data to memory.

IC1 uses a 10-MHz input-clock frequency. A 74HCT74 counter (IC19) divides down this clock to form the clock input to IC2. The standard 8237 operates from a 3-MHz maximum clock frequency, so you can divide the 10-MHz clock by 4 to provide IC2's clock. You'll have a resultant acquisition rate of 608k samples/sec. A faster version of the 8237, the 8237-5, operates from a 5-MHz input clock, allowing you to divide the clock frequency by 2 and enabling the circuit to take 812k samples/sec. If you were to use IC1 on its own to control the sampling of the input waveform, the best acquisition rate you could obtain would be approximately 100k samples/sec.

The entire circuit operates from 15V and 5V sup-

Fig 7—Although the 8052 does not support true DMA, you can create a “fake DMA” mode, which, though not as fast as real DMA, lets you transfer blocks of data directly to memory.

plies. If there isn't a 5V supply in your system, you can add a regulator to generate 5V. In addition, plan to use a precision 5V reference (IC5) for the A/D converter, allowing an input range of 0 to 5V. To obtain accurate conversion results, you must obey the same guidelines regarding decoupling and grounding as apply to the transient-recorder circuit.

You can use the same design (Fig 6) with slow- and medium-speed microprocessors that support DMA requests. With these microprocessors, you'll find the DMA response time will be much faster than the response of the 8052's “fake DMA.” Because microprocessors that support genuine DMA will 3-state their address and data lines during a DMA transfer, you can eliminate the 3-state driver chips.

Authors' biographies

Ken Dewey is a senior design engineer responsible for developing CMOS and BiCMOS data-acquisition ICs at Analog Devices in Limerick, Ireland. He has been with Analog for more than seven years. He holds Bachelor's and Masters' degrees in engineering from the University of Limerick and is a member of the IEEE. His leisure activities include 5-on-a-side soccer, badminton, running, and reading.

Dan Sheehan is a test engineer responsible for all aspects of burn in, life test, and production at Analog Devices in Limerick, Ireland. He has been with Analog for more than 11 years. He holds a diploma from the University of Limerick. He lists his leisure activities as running, rowing, and reading.

Mike Byrne is a senior project engineer specializing in applications and customer support at Analog Devices in Limerick, Ireland. He has been with Analog for more than 10 years. He holds a BS in electronics from the University of Limerick. His leisure activities include outdoor sports and music.

Tango is the pacesetter in affordable, PC-based electronic design with the quality and productivity that engineering professionals demand, and the easiest-to-use interface available on any platform, at any price.

**Tango's powerful line-up.** Build your personal CAE/CAD workstation with Tango's start-to-finish design tools. Tango-Schematic, includes over 10,000 different parts. Experience Tango-PLD's powerful approach to top-down logic design with its C-like design language and schematic entry options. Add interactive logic simulation with Susie.

Affordably-priced, our popular PCB layout tools have designed tens of thousands of boards. There's Tango-PCB PLUS, for complex designs and Tango-PCB, a comprehensive, yet economical program for less demanding requirements. Tango designers have three fast and efficient autorouting options: the high-performance Tango-Route; multi-grid, multi-layer Tango-Route PLUS; and Tango-Route PRO, the fastest PC-based, high-completion autorouter with its automated operation and advanced SMT support.

**Tango's unrivaled after-sale support.** Your investment in Tango software includes clear, concise documentation; responsive, knowledgeable technical support; affordable feature-based updates; our 24-hour Tango BBS; directories of service bureaus and design consultants; a quarterly newsletter; and our 30-day money-back guarantee.

Give us a call to discuss your own design requirements. You'll find our customer service is as friendly as our software. Call for complete specs and free evaluation packages.
Goes great
If you've been following the developments in high-density multichip modules, you know the great promise that lies there.

If you've been leading the developments, however, you know the great problem that lies there.

Namely, the search for a polymer dielectric that can make multichip modules truly practical.

For which reason we are pleased to introduce you to new bisbenzocyclobutenes (BCBs) from Dow.

BCBs offer big advantages over the polyimides you may have been experimenting with. To start, they simply perform better—by about 50%. And in the process, they simplify manufacturing and lower your overall costs.

CHIPS WITHOUT RIDGES.

Where does BCB’s advantage come from?

For one thing, from its extremely low dielectric constant. In general, you can get away with layers 25% thinner than you’d need with polyimides. This means higher density and, therefore, higher performance.

You also get much better leveling than with polyimides. BCB planarizes more than 90%, compared with the 30% or less typical of polyimides. This nearly ridgeless surface reduces crosstalk and improves etching as well.

And BCB can take the heat, literally. It shows great thermal stability at curing temperatures. This, together with its naturally low modulus, gives you a finished module created with less stress than one made with most polyimides.

NO MORE SOGGY CHIPS.

Water, a byproduct of the polyimide curing process, is the enemy of the multichip module. It complicates manufacturing and robs polymers of their dielectric appeal.

BCB, on the other hand, produces no water. So there’s no need for additional drying during manufacture. And since it vigilantly resists moisture (absorbing just 0.25% of its weight after 24 hours at 100°C), the dielectric properties you design in, stay in.

BCB also offers excellent adhesion to aluminum, copper, silicon dioxide—and to itself.

So there’s no need for the metal tie layers other dielectric materials require.

YOUR CHIPS, OUR DIP.

All in all, this means you can manufacture high-density modules faster, with fewer rejects and, therefore, less expensively with BCB. And wind up with modules that perform far better than they would with polyimides.

If BCB sounds good in theory, we invite you to learn from the experience of those who have put it into practice—including one manufacturer who has successfully gone into full commercial production.

If you’d like more information, call us today at 1-800-441-4DOW.
With our new FASTr and BCT logic, high speed and low power go hand in hand.

Get the best of both worlds.

When specifying logic, you're often faced with a high-performance compromise. On the one hand you want high speed, while on the other hand you want low power. In a best-case scenario, you'd have both.

Specify our new FASTr™ and BCT logic and that's what you'll get. Without the compromise. Now you can realize the full potential of a bipolar/BiCMOS combination that delivers high speed and low power to an almost endless array of bus interface applications.

FASTr is the world's fastest TTL logic.

If raw speed is your primary concern, take advantage of FASTr, which checks in at 3.9ns max. Also take advantage of its 64mA drive and low-noise, bipolar circuitry.

BCT balances speed and power.

Combining bipolar and CMOS, BCT provides the ideal process mix that's a perfect match for low-power applications requiring high speed. Which means 10mA ICC and 5.5ns.

System specs.

Guaranteed AC specs and enhanced reliability enable you to maximize your system's potential. And further illustrate why FASTr and BCT are the logic of choice—hands down.

Feedback models reduce op-amp circuits to voltage dividers

An op amp’s feedback factor defines a range of performance characteristics. Unfortunately, this factor is unknown for most op-amp applications because of a limited feedback model. By extending this model you can create a generalized feedback model that reduces op-amp circuit analysis to determining voltage-divider ratios.

Jerald Graeme, Burr-Brown Corp

The feedback factor of an op-amp circuit defines that circuit’s performance more than any other parameter. The feedback factor sets the gain of the op amp’s input-referred errors. These errors include offset voltage, noise, and the error signals generated by limited open-loop gain, common-mode rejection, and power-supply rejection. In addition, a circuit’s feedback factor determines bandwidth and frequency stability. Yet this powerful performance indicator remains unknown for most op-amp applications. Except for the basic noninverting op-amp connection, the classic feedback model does not predict the feedback factors of op-amp circuits.

In the noninverting case, the closed-loop gain relates directly to the feedback factor; the application gain itself determines the output errors and bandwidth. However, the relationship between the gain and feedback factor does not extend to other op-amp configurations. In other configurations, several conditions make the gain-feedback relationship unclear. The input and output signals of inverting op-amp connections, for example, combine on the feedback network to conceal the feedback factor. Other applications have both positive and negative feedback, which results in more than one feedback factor. In still other applications, bootstrap feedback adds another variable that the classic feedback model does not take into account. Without knowing the feedback factor, you must perform laborious calculations to determine these circuits’ performance.

You can, however, extend the convenience of a feedback factor to these other circuits by modifying the classic op-amp feedback model. Specific connection examples can demonstrate the possible variations to this model. These variations are limited in number by the two inputs of an op amp; you can connect the input and feedback signals of an op amp in only a few ways. The examples in Figs 1 through 11 demonstrate modeling principles that will let you create a feedback model for any op-amp configuration. The final example is a universal op-amp feedback model that has standardized performance equations.

For the noninverting op-amp configuration, a direct relationship between the closed-loop gain and the feedback factor simplifies analyzing circuit performance.
The feedback factor of an op amp defines the circuit performance more than any other parameter.

Fig 1 shows this configuration as a voltage amplifier. This noninverting circuit provides the familiar, ideal closed-loop gain ($A_{CL}$): $A_{CL} = \frac{R_1 + R_2}{R_1}$. This gain amplifies both the input signal ($e_i$) and the differential input errors ($e_{ID}$) of the op amp. Multiplying the input-referred amplifier errors by $A_{CL}$ yields the resulting output errors.

As you can see in the Fig 1 model, the mechanism relating both the input and output errors is the feedback factor. This model represents the noninverting op-amp connection by an amplifier with differential-input-error signal $e_{ID}$ and feedback factor $\beta$. This feedback factor defines the portion of the output signal ($e_o$) that feeds back to the amplifier input. Writing a loop equation for this model shows that $e_o = \frac{1}{\beta}(e_i - e_{ID})$. Thus, the feedback model shows that $1/\beta$—rather than $A_{CL}$—amplifies $e_i$ and $e_{ID}$.

To resolve this amplification difference, define the noninverting amplifier’s feedback factor. The feedback factor is the fraction of the amplifier’s output that feeds back to its input. In Fig 1, the voltage-divider action of the feedback resistors sets the fraction of $e_o$ fed back to the op-amp input: $\beta e_o = e_o R_1 / (R_1 + R_2)$.

This relationship defines $\beta$ as the voltage-divider ratio of the feedback network. Comparing this result with the $A_{CL}$ expression shows that $A_{CL} = 1/\beta$ for the noninverting op-amp configuration. Thus, the circuit and model are in agreement for the input-to-output transmission of amplifier errors.

The types of amplifier errors this model takes into account are numerous because $e_{ID}$ includes errors related to several amplifier characteristics. Each of these characteristics produces an input-referred error source for the op amp. The following formula represents error sources related to op-amp input-offset voltage ($V_{OS}$), input-noise voltage ($e_n$), open-loop gain ($A$), common-mode rejection ratio (CMRR), and power-supply rejection ratio (PSSR). The last three error terms include circuit signals: the output voltage ($e_o$), the common-mode voltage ($e_{CM}$), and the change in power-supply voltage ($\delta V_S$):

$$e_{ID} = V_{OS} + e_n + \frac{e_o}{A} + \frac{e_{CM}}{CMRR} + \frac{\delta V_S}{PSRR}.$$ 

To find the amplifier output errors each of these terms creates, multiply each term by the $1/\beta$ factor of the application circuit. Some familiar error terms result from this multiplication. The output error due to the finite open-loop gain becomes $e_o/A$, which shows that the output signal is diminished by a fraction equal to the reciprocal of loop gain $A\beta$. The decline of open-loop gain $A$ with frequency makes this output error rise, thus shaping the closed-loop frequency response of the circuit. The output-noise error term is $e_n/\beta$, leading to the term “noise gain” for $1/\beta$. This description of $1/\beta$ is accurate only under certain bandwidth limits. For both the loop-gain and noise errors, greater insight into circuit performance results from frequency-response analysis.

For the noninverting circuit in Fig 1, the multiplier...
that relates the input and output errors conveniently equals $A_{\text{CL}}$. Other op-amp configurations do not share this convenience. For these configurations, you must determine the $1/\beta$ factor independently of the ideal closed-loop gain. Once you determine this factor, the error-analysis process is the same as that of the Fig 1 circuit.

For these more-complex op-amp configurations, you need to use feedback modeling to determine the feedback factor. This modeling also yields frequency-response and frequency-stability information. To demonstrate modeling, consider the familiar noninverting circuit in Fig 2. This noninverting configuration highlights the voltage-divider action of the feedback network. For more general use, the network has impedances $Z_1$ and $Z_2$ rather than the resistors in Fig 1. As before, the network's divider action controls the fraction of the amplifier output fed back to the amplifier input. The Fig 2 circuit reduces input-error-signal $e_{iD}$ to the value of the open-loop gain error, $e_0/A$. This reduction is due to the fact that the feedback modeling focuses only on gain and related frequency characteristics. Nevertheless, the one input-referred error is sufficient to define the feedback factor for use with the previous multi-error analysis.

Fig 2 also shows the feedback model for the noninverting op-amp connection. This classic feedback model, initially developed by Black (Ref 1), is generally proposed for op-amp circuits. However, this model applies only to the noninverting case and needs modification for other configurations. The model represents amplifier gain by gain-block $A$. A summation block, $\Sigma$, drives the inputs of the gain block. The summation block's inputs are input-signal $e_1$ and feedback-signal $\beta e_0$. The feedback signal flows through feedback-attenuator block $\beta$. The summation block applies different polarities to the two signals, as the $+$ and $-$ signs indicate. These polarities correspond to the amplifier-input polarities of the actual circuit.

You can demonstrate the validity of the model by comparing the closed-loop-gain ($A_{\text{CL}}$) responses for the model and the circuit. For the model, the output signal is $e_0 = A(e_1 - \beta e_0)$. Solving this equation for $e_0/e_1$ defines the modeled transfer response of the noninverting circuit as

$$A_{\text{CL}} = e_0/e_1 = A/(1 + A\beta).$$

For the actual circuit of Fig 2, the transfer response of a noninverting amplifier is

$$A_{\text{CL}} = \frac{e_0}{e_1} = \frac{A}{1 + \frac{AZ_0}{Z_1 + Z_2}}.$$ 

Comparing the terms in the last two equations shows that the feedback factor is $\beta = Z_1/(Z_1 + Z_2)$.

The preceding analysis confirms the accuracy of the
Except for the basic noninverting case, the classic feedback model does not predict the feedback factor of op-amp circuits.

Fig 2 model and provides the basis for determining the frequency response and stability of the circuit. This added performance information is based on the feedback factor and is not specific to the noninverting case. Using feedback modeling, you can derive the frequency characteristics of an op-amp circuit by analyzing the model's closed-loop-response equation (Ref 2). For the noninverting case, you can rewrite this equation as

\[ A_{CL} = \frac{1}{1 + \frac{1}{A\beta}} \]  

(1)

Other op-amp configurations have different closed-loop-response equations, but these equations always have the same \(1 + \frac{1}{A\beta}\) denominator. This common denominator is central to the bandwidth and stability characteristics that hold for all op-amp configurations.

The frequency response of the Fig 2 circuit begins with the value of the ideal closed-loop gain \(A_{CLI}\) at dc. Because the op-amp open-loop gain \(A\) is very high at dc, the previous closed-loop-response equation simplifies to the ideal gain of the noninverting circuit: \(A_{CLI} = \frac{1}{\beta}\). At higher frequencies, the op-amp open-loop gain \(A\) declines, causing the closed-loop gain to drop from the ideal value. This drop produces the circuit's bandwidth limit, as shown in Fig 3, which is a plot of the op amp's closed-loop response, its open-loop gain, and the reciprocal of the feedback factor. All three variables of the original closed-loop-response equation are plotted on the same graph. The manner in which these variables interact in Fig 3 provides visual insight into bandwidth and frequency-stability limits.

The circuit-loop gain, \(A\beta\), represents the amplifier gain resource available to maintain the ideal closed-loop response. In Fig 3, the separation between the A and \(1/\beta\) curves represents the loop gain. Because of the logarithmic scale of response plots, this separation equals \(\log (A) - \log (1/\beta)\), which equals \(\log (A\beta)\). Thus, at any given frequency, loop-gain \(A\beta\) is the vertical distance between the A and \(1/\beta\) curves. Where the loop gain can no longer match the feedback demand, the closed-loop curve drops from the ideal \(A_{CLI}\). The A and \(1/\beta\) curves graphically define this point. The \(1/\beta\) curve represents the feedback demand, and ideal closed-loop requirements are met as long as \(1/\beta\) is below the open-loop-gain curve. Where this condition is no longer true, the actual response drops and follows the amplifier open-loop response downward. The rate of descent for the roll-off is \(-20\,\text{dB/decade}\) for most op amps, a slope that is characteristic of a single-pole response. The heavier curve in Fig 3 represents the resulting closed-loop gain, \(A_{CL}\).

The location of pole \(f_p\) in the \(A_{CL}\) response roll-off determines the closed-loop bandwidth of the circuit. At the pole frequency, \(A_{CL}\) drops from its dc level of \(1/\beta\) to 0.707/(1/\beta). This drop assumes that resistor feedback produces a frequency-independent \(\beta\). Under this condition, the gain drop occurs at the intercept frequency of the A and \(1/\beta\) curves. These curves are actually magnitude response curves, and, at their intercept, \(|A| = 1/\beta\) or \(|A\beta| = 1\). The single-pole roll-off of gain \(A\) develops a phase of \(-90^\circ\). Thus, \(A\beta = -j1\) at the intercept, and the denominator of Eq 1 is \(1 + (1/A\beta) = 1 + j1\).

At the intercept, the magnitude of the denominator increases from its dc level of 1 to \(\sqrt{2}\), and \(A_{CL}\) drops to 0.707/(1/\beta). Thus, for frequency-independent feedback factors, the 3-dB bandwidth occurs at the intercept frequency of the A and \(1/\beta\) curves. Where the feedback factor is frequency dependent, the closed-loop response still rolls off following the intercept, but this point may not be the 3-dB bandwidth limit. Peaking in the closed-loop response curve may move the actual 3-dB point away from the intercept frequency.

For more-common op-amp applications, the feedback
factor is constant, and a simple equation defines the 3-dB bandwidth. The open-loop response of most op-amps has a single-pole roll-off. Virtually all intercepts of the A and $1/\beta$ curves occur in this single-pole range. In this range, the gain magnitude is $A = f_0/f_c$, where $f_c$ is the unity-gain crossover frequency of the amplifier. At the intercept, $f = f_p$, and $A = 1/\beta = f_c/f_p$. Solving for $f_p$, the 3-dB bandwidth (BW) for most op-amp applications is $BW = f_p = \beta f_c$.

This result holds for all op-amp applications having frequency-independent $\beta$s and a single-pole op-amp roll-off. In other cases, you find the 3-dB response limit by considering the added phase shift caused by the increased amplifier roll-off or by a frequency-dependent feedback factor.

Knowing the $A_{CL}$ frequency response, you can refine the simple analysis of Fig 1 so you can apply it to broader frequency ranges. The previous analysis showed that input-referred errors of op-amps transfer to the amplifier output through a gain of $A_{CL1} = 1/\beta$. However, both $A_{CL1}$ and $1/\beta$ are independent of the amplifier's high-frequency limitation. The Fig 1 analysis is valid only when the op amp has sufficient gain to support the feedback demand. The 3-dB bandwidth marks a response roll-off that reduces amplification of both the signal and the error. Thus, op-amp error signals receive a gain of $A_{CL} = 1/\beta$ only to the frequency where $BW = \beta f_c$. Beyond this limit, the gain available to error signals rolls off and follows the op-amp open-loop response in Fig 3.

This roll-off produces the difference between $1/\beta$ and the noise gain. The noise gain follows the roll-off Fig 3 describes even though the $1/\beta$ curve continues uninterrupted. The denominator of the $A_{CL}$ equation (Eq 1) expresses this roll-off. The closed-loop error gain, $A_{CLE}$, is

$$A_{CLE} = \frac{1/\beta}{1 + 1/\beta A\beta}.$$  

This error gain is frequency dependent. Higher-frequency noise and CMRR and PSRR errors receive diminishing gain. Note that $A_{CLE}$ depends on only the variables $\beta$ and $A$. Any feedback model with $\beta$ and $A$ blocks configured as in Fig 2 yields the same expression for $A_{CLE}$. This model configuration and the $A_{CLE}$ result apply to all op-amp configurations.

Using response plots like Fig 3, you can evaluate the frequency stability of an op-amp circuit from the curve slopes. The slopes of the A and $1/\beta$ curves at their intercept indicate phase shift for a critical feedback condition. At this intercept, $|A\beta| = 1$; a loop phase shift of $180^\circ$ makes $A\beta = -1$. Then, the $1 + (1/A\beta)$ denominator of Eq 1 is zero, and $A_{CL}$ is infinite. With infinite gain, a circuit can support an output signal in the absence of an input signal, meaning the circuit can oscillate. To prevent oscillation, you must keep the phase of $A\beta$ below $180^\circ$. To prevent response ringing, you must further limit this phase to $135^\circ$ or less.

You determine the loop phase shift by relating phase shifts to the slopes of the gain magnitude and $1/\beta$ curves. The relationship between the response slope and the phase shift is based on the effects of response poles and zeros. A pole creates a $-20$-dB/decade response roll-off and $-90^\circ$ of phase shift; a zero produces the same effects but with opposite polarities. Additional poles and zeros add response slopes and phase shifts in increments of the same magnitudes. The slope and phase correlation is an accurate approximation when the critical intercept is well separated from response-break frequencies. When the intercept is less than one decade from a response break, you have to use a more detailed phase analysis (Ref 2). Even in these cases, the response slopes provide insight into probable stability behavior.

Relying on the slope and phase correlation, you determine the feedback phase shift from the gain magnitude and $1/\beta$ curves. The intercept point in Fig 3 occurs after the amplifier's first pole develops the $90^\circ$ phase shift but well before the second pole has any effect. At the intercept, the gain-magnitude curve has a slope of $-20$ dB/decade, and the $1/\beta$ curve has zero slope for a net $90^\circ$ feedback phase shift. The result leaves a phase margin of $90^\circ$ from the $180^\circ$ needed to cause oscillation. The zero slope of the $1/\beta$ curve in Fig 3 is characteristic of voltage-amplifier op-amp applications. In these applications, resistors form the feedback network. In other applications, capacitors are often part of this network and effect a nonzero $1/\beta$ slope.

Inverting configuration extends model

You can define the feedback factor and closed-loop gain for less obvious op-amp configurations by extending feedback modeling. The following examples demonstrate modifications of the Fig 2 basic feedback model that you need for alternate signal and feedback connections. In each case, the $A_{CL}$ transfer-function
The input and output signals of inverting op-amp connections combine on the feedback network to obscure the feedback factor.

has a denominator of $1 + (1/\beta \beta)$, and Eq 2 describes the error-signal gain.

The first example is the simple inverting op amp (Fig 4). This circuit interchanges the ground and $e_1$ connections of Fig 2. This modification complicates determining the feedback factor for both the circuit and the model because the fraction of the amplifier output fed back to the input is not immediately obvious. The inverting input of the op amp is held near zero voltage by the inherent operation of an inverting circuit. This action results because the voltage at the inverting input receives counteracting signals from $e_0$ and $e_1$.

The signals the op amp receives result from the voltage-divider action of the feedback network; $e_0$ and $e_1$ drive the divider at opposite ends. Superposition of these divider actions shows that the signal at the amplifier's inverting input or summing junction ($e_{SJ}$) is

$$e_{SJ} = \frac{e_0 Z_1 + e_1 Z_2}{Z_1 + Z_2 + Z_1 + Z_2}.$$  

The first term of this equation shows that $Z_o/(Z_1 + Z_2)$ remains the fraction of the output fed back to this input. Thus, for op-amp feedback networks, the feedback factor is the voltage-divider ratio of the network, regardless of the signals present in the actual circuit.

Analyzing Fig 4 with the feedback model requires you to adjust for the input-signal connection. The classic feedback model of Fig 2 shows $e_1$ driving a noninverting or positive input at the summation point. This arrangement corresponds to the signal connection at the amplifier's noninverting input. However, in Fig 4, $e_1$ is coupled to the amplifier's inverting input rather than its noninverting input. Fig 4 accommodates this difference by changing the sign of the corresponding summation input. In op-amp feedback modeling, assign all summation inputs the same polarities as the corresponding amplifier inputs.

Also, the Fig 2 model shows $e_1$ connected directly to the summation point in accordance with the direct connection of the circuit. Fig 4, however, shows $e_1$ connected to the feedback network rather than directly to the amplifier input. This network attenuates the amplifier input as the equation for $e_{SJ}$ reflects. To include this attenuation in the feedback model, Fig 4 adds feed-forward factor $\alpha$. This feed-forward factor is the fraction of the input signal fed forward to the amplifier input. As with the feedback factor, a voltage-divider ratio of the feedback network defines the feed-forward factor. For $\alpha$, the divider ratio is taken from the opposite end of the feedback network. For Fig 4, $\alpha = Z_o/(Z_1 + Z_2)$. In practice, every input signal connection to a feedback model has a corresponding $\alpha$. For direct signal connections to amplifier inputs, $\alpha$ is unity.

Extended model simplifies inverter analysis

Using these model adjustments, you can extend feedback analysis to predicting the performance of inverting circuits. The feedback model of Fig 4 sums the input and feedback signals for $e_0 = A(-\alpha e_1 - \beta e_0)$. Solving this equation for $e_0/e_1$ yields the model response. Fig 4 compares the model with the corresponding circuit. Comparing terms confirms the defined values of
\[ A_{CL} = \frac{-\alpha}{1 + 1/\alpha \beta}. \]

When the loop-gain \( \alpha \beta \) is large, the equation reduces to the ideal closed-loop gain of \( A_{CLI} = -\alpha/\beta = -Z_2/Z_1 \).

The magnitude of this closed-loop gain is lower than the \((Z_1 + Z_2)/Z_1\) of the noninverting case, but the bandwidth is correspondingly higher. This relationship results from the fact that the feedback factor—not the closed-loop gain—controls the bandwidth. The two circuits have the same feedback factor even though their gain magnitudes are different. As a result, the gain-bandwidth product drops when the circuit changes from the noninverting to the inverting configuration.

To quantify bandwidth for the inverting case, the previous noninverting analysis transfers directly. This transfer results from the standard form of the response equations. The noninverting bandwidth was derived from the denominator of the \( A_{CL} \) response (Eq 1). That same \( 1 + (1/\alpha \beta) \) denominator applies to the inverting case as Eq 3 shows. In both cases, the \( A_{CLI} \) numerator reflects the ideal closed-loop gain. As in Fig 2, the bandwidth for the inverting op-amp connection is \( \beta f_c \), even though the closed-loop gain has decreased.

This \( \beta f_c \) relationship extends to all other op-amp configurations as well. You can write the transfer response of any negative-feedback system in a form that includes the \( 1 + (1/\alpha \beta) \) denominator. In this form, the numerator of the response equation reflects the ideal closed-loop gain. This gain describes the transfer response when \( \alpha \beta \gg 1 \), thus making the denominator essentially unity. The standard equation for the generalized transfer response for any op-amp configuration is

\[ A_{CL} = \frac{A_{CLI}}{1 + 1/\alpha \beta}. \]

Feedback modeling can reduce the transfer response of any op-amp connection to this generalized form. The conclusions you draw from this standard equation translate to all op-amp connections. Rederiving the characteristics of each individual configuration is unnecessary. The only variable factor is ideal-gain \( A_{CLI} \), which you express in terms of \( \alpha \) and \( \beta \) combinations that are unique to a given configuration. For a given configuration, you can find \( A_{CLI} \) by writing the response of the feedback model in the standard form.

You can also express the op-amp input-error gain, \( A_{CLE} \), in a generalized form. In this case, there are no differences between the equations for different amplifier configurations. For Fig 4, this gain is the gain of error-signal \( e_o/A \). This gain also affects the other input-referred error signals of \( e_{IO} \). For the Fig 4 circuit, you can find \( A_{CLE} \) by using superposition and a test signal. Setting \( e_1 \) to zero, you add a second error signal, such as noise \( e_N \), to the \( e_o/A \) error signal. This procedure has the same effect as adding an \( e_N \) generator in series with the amplifier's noninverting input. The gain of this configuration amplifies such a signal, and

\[ A_{CLE} = \frac{1/\beta}{1 + 1/\alpha \beta}. \]

Thus, \( A_{CLE} \) for the inverting configuration is the same as that of the noninverting case. Further examples show this equation to be true for all configurations. Op-amp input-referred error signals are amplified by \( 1/\beta \) up to the response roll-off of \( 1 + 1/(\alpha \beta) \) denominator creates. From the Fig 3 discussion, this roll-off starts with the closed-loop bandwidth of the amplifier. Beyond this bandwidth limit, \( A_{CLE} \) follows the op amp's open-loop response.

**Multiple paths extend possibilities**

Other variations of op-amp configurations result from dual feedback paths or dual input-signal connections. Fig 5 shows a configuration with feedback to both amplifier's inputs. A voltage-follower connection provides unity feedback to the inverting input, and a feedback network supplies positive feedback to the noninverting input. Normally, positive feedback degrades circuit stability, but, in the Fig 5 example, the opposite is true. Positive feedback is useful when a greater negative feedback makes the overall circuit feedback negative. The combined feedback effects determine circuit operation, as feedback modeling illustrates.

The purpose of the dual feedback is to achieve voltage-follower operation with an op amp that is not phase compensated for unity-gain stability. Normally, a voltage follower must have unity-gain stability because of the follower's unity feedback. However, some op amps lack this stability because of reduced internal phase compensation. Numerous op amps offer different degrees of phase compensation. Often, one product ver-
You can extend the feedback-factor convenience to all op-amp circuit configurations through feedback modeling.

The slew rate of the OPA37 in Fig 5 is 12V/µsec, and the device's phase compensation is set for gains of five or greater. A companion product, the OPA27, has unity-gain phase compensation, but its greater compensation reduces the slew rate to 2V/µsec. Typically, the devices' slew rates differ by a factor approximately equal to the minimum gain of the lesser compensated version.

Modifying the circuit's feedback factor makes the higher slew rate available to the voltage follower. The modification reduces the feedback factor without altering the closed-loop gain, which removes the requirement for unity-gain phase compensation. The frequency stability of an op-amp configuration depends on the phase shift at the intercept of the A and 1/β curves. Fig 5 shows these curves for the reduced phase compensation and added positive feedback of the example. Because of the reduced compensation, the open-loop-gain curve A exhibits two response poles above the unity-gain axis. As a result, the slope of this curve is -40 dB/decade when the curve reaches unity gain.

This slope corresponds to 180° of phase shift and indicates oscillation for a 1/β intercept at unity gain. Normally, this intercept would result with a voltage follower where 1/β = 1. However, the positive feedback of the Fig 5 circuit reduces the net feedback factor to raise the 1/β curve. The raised curve places the intercept in a region of reduced open-loop-gain slope and ensures frequency stability.

Raising the 1/β curve also moves the intercept back in frequency, which reduces the closed-loop bandwidth. In practice, this bandwidth reduction is the same as that produced by using the unity-gain compensated version of the amplifier as a conventional voltage follower. In that case, the added internal phase compensation reduces the bandwidth. To get the greatest bandwidth from the circuit in Fig 5, set the intercept at the level of the amplifier's minimum rated gain. This intercept condition results in 1/β = A_{MIN}, where A_{MIN} is the minimum stable gain the manufacturer specifies for the amplifier.

To permit this feedback setting, you must determine the value of β for Fig 5. Once again, the feedback-factor definition and the basic feedback model fail in this task. Determining the fraction of the output fed back to the input is complicated by the dual feedback paths. The classic feedback model of Fig 2 offers no help because it represents only one feedback path. Fig 6 extends the Fig 2 model to the dual-feedback circuit of Fig 5 by incorporating two adjustments. First, the model adds feed-forward factor α in series with the signal input, following the process described for Fig 4. However, the model couples e, to the positive inputs on the amplifier and summation elements.

The second model change is the addition of the β, feedback path, which connects to a positive input on
the summation element. The summation polarity then matches that of the amplifier input the β, feedback-path affects. Feedback through β, remains connected to a negative summation input, and the two feedback polarities reflect the differential nature of the amplifier. The differential inputs of an op amp cause the amplifier to respond to the difference between the signals at the two amplifier inputs. Thus, the amplifier subtracts the two feedback signals when the signals are connected to opposite amplifier inputs. The model repeats this subtraction by using opposite signs for feedback inputs to the summation element.

**Dual feedback subtracts feedback factors**

The differential inputs' subtraction results in a net feedback factor that is the difference between the positive and negative feedback factors. Analyzing the circuit and model results in the response equations in Fig 6. The response denominator is of the standard form $1 + (1/A\beta)$ when the net circuit feedback factor is $\beta = \beta_+ - \beta_-$. Then, the equations confirm the Fig 6 model to the amplifier configuration, and

$$A_{CL} = \frac{\alpha/\beta}{1 + 1/A\beta} = \frac{A_{CLI}}{1 + 1/A\beta}$$

$$\beta = \beta_+ - \beta_-.$$

Note that, because the net feedback is negative, the net feedback factor is $\beta_+ - \beta_-$, rather than $\beta_- - \beta_+$.

To determine the ideal gain, $A_{CLI} = \alpha/\beta$, express the α and β factors in terms of circuit elements. Although the equations for Fig 6 define these factors, depending on detailed equations is no longer necessary. Once the equations confirm the model, you do not need them to repeatedly analyze a given configuration. The $A_{CL}$ expression of the model defines $A_{CLI}$ in terms of factors you can determine by inspection. You determine the feedback and feed-forward factors from the associated voltage-divider ratios. The ratio is unity for the direct output-to-input connection of the Fig 6 $\beta_-$ feedback. However, the Fig 6 model also holds for other cases in which a feedback network sets $\beta_-$.

For the specific circuit of Fig 6, the result is the desired voltage-follower response; however, the circuit amplifies any errors. Reading the individual factors from the Fig 6 circuit and subtracting the two $\beta$ factors gives

$$\alpha = \beta = \frac{Z_2}{Z_1 + Z_2}.$$

Thus, $A_{CLI} = \alpha/\beta = 1$ for the desired voltage-follower response. However, with $\beta < 1$, the input errors of the amplifier are amplified by $1/\beta > 1$. Given the $\beta$ selection for Fig 5, $1/\beta = A_{MIN}$. Then, the input errors are amplified by approximately the same factor that slew rate is improved. For the specific components of Fig 5, the input errors are amplified by a factor of five, and the slew rate improves by a factor of six. The error-signal

![Diagram](image-url)
With feedback modeling, you can simplify op-amp circuit analysis to the determination of voltage-divider ratios.

gain rolls off in accordance with the amplifier open-loop response, as the equation for $A_{CL\text{E}}$ (Eq 4) shows. You can remove the increased error gain for the input offset voltage by using a capacitor in series with $R_2$ in Fig 5.

The reduced input impedance of the Fig 5 circuit also increases the error. However, this effect is less than you would first expect. At first, the input impedance of the circuit appears greatly reduced because the input signal drives a feedback network. Normally a voltage follower presents the very high impedance of an op-amp input to the signal source. When driving the feedback network in an inverting circuit, the input signal sees the impedance of the input resistor. This great difference in input impedance would also result for Fig 5 except for the bootstrap action of the positive feedback. The follower action of the circuit keeps both ends of the feedback network at almost the same signal level. The only signal appearing on $Z_2$ in Fig 6 is the small $e_0/A$. Thus, the feedback network draws very little current from the signal source. The resulting input impedance is $R_1 = AZ_2$.

**Dual inputs expand options**

Still other op-amp configurations couple input signals to both inputs of the amplifier. For these configurations, modify the feedback model on the input rather than the feedback side. The input signals coupled to the op amp may be from the same signal source or from separate sources. In the simplest case, the same signal source supplies both op-amp inputs, serving to illustrate input modifications for the model.

**Fig 7** shows the dual-coupling of a signal source to the two op-amp inputs. This circuit selectively amplifies the op amp’s input-error signal for greatly improved resolution of error measurement. Distortion measurement is a prime beneficiary of this selective gain. Input-error-signal $e_{ID}$ appears across $R_1$ and develops a feedback current of $e_{ID}/R_1$. This current also flows through $R_2$ and develops an amplified replica of $e_{ID}$ at the op-amp output. The resulting error-signal gain is $(R_1 + R_2)/R_1$. This gain equals $1/\beta$ as you can see by reading $\beta$ from the voltage-divider ratio of the feedback network.

The amplification excludes test-signal $e_1$ because this signal does not appear across $R_1$. The circuit bootstraps $R_1$ on top of $e_1$; the resistor supports only the amplifier-input-error signal. Signal $e_1$ shifts the op-amp input voltages without developing a voltage across $R_2$. With no related signal on $R_2$, the op-amp output follows $e_1$. Thus, signal $e_1$ receives only unity gain from the circuit, and the amplifier error signal receives a gain of $1/\beta$. Because of this selective amplification, the amplified error signal is far more prominent at the amplifier output. The selective gain reduces the dynamic-range requirements for the error measurement. In addition, the unity gain presented to $e_1$ lets this signal span the full voltage range of the op-amp input without causing output saturation.

However, this selective gain also reduces the feedback factor, resulting in bandwidth reduction. Distortion measurements must accurately predict the resulting bandwidth to determine the number of higher-frequency harmonics the circuit amplifies. From a circuit perspective, the Fig 7 configuration illustrates the effect of $\beta$ on bandwidth. For this circuit, the output voltage is $e_0 = e_1 - (e_{ID}/\beta)$. Thus, $e_0$ diminishes from the level of $e_1$ in the presence of $e_{ID}$. Part of signal $e_{ID}$ is the gain error, $e_{V}/A$, which causes higher-frequency roll-off in the closed-loop response. For bandwidth considerations, $e_{V}/A$ replaces $e_{ID}$, and the resulting output voltage is $e_0 = e_1 - (e_{V}/A \beta)$. As open-loop-gain $A$ declines with frequency, the output signal increasingly diminishes. At some point, the drop in output reaches the $-3$-dB point of the bandwidth limit. The circuit reaches this limit sooner because of the presence of $\beta$ in the $e_0$ equation. The roll-off effect of $A$ is amplified by $1/\beta$, which reduces the bandwidth by the same factor. As before, $BW = \beta_0$.

The performance of Fig 7 is very similar to that of Fig 5. Both circuits maintain unity gain to the signal source but the amplifier operates with $\beta < 1$. For Fig 5, the reduced feedback factor permits less amplifier phase compensation but results in greater gain to the error signals. Fig 7 intentionally adds gain to the error signal.
No other op amps match the new MAX402 and MAX403's combination of high speed and micropower operation. At only 375µA supply current, the 10MHz MAX403 slew at 40V/µs—14 times faster than the industry standard OP27 at less than 1/10th the supply current. For applications requiring even lower power, the MAX402 has a 2MHz bandwidth and 7V/µs slew rate while drawing less than 75µA supply current. The MAX402 and MAX403 are both unity gain stable. They operate from ±3V to ±5V supplies, or a single supply from 6V to 10V, making them ideal for low power signal processing and remote sensors.

Using information based on the feedback factor, you can determine the frequency response and stability of an amplifier as well as its gain.

Signal for measurement applications. The only difference between the two circuits lies in their applications. In practice, the circuits realize the same results through different configurations. From an applications standpoint, the two circuits are interchangeable.

The primary difference between the two circuits is in the feedback modeling. Fig 5 demonstrates dual feedback, and Fig 7 shows dual input connections. Fig 8 shows the Fig 7 modeling results by redrawing the circuit to show the two input connections. The Fig 8 circuit couples input-signal e₁ directly to the amplifier's noninverting input. For the model, the direct connection represents an α of unity and connects e₁ directly to a positive input of the summation element.

The circuit also couples signal e₁, which a feedback network attenuates, to the inverting input of the amplifier. This attenuation defines a feed-forward factor equal to the voltage-divider ratio Z₂/(Z₁+Z₂). In the model, the α block represents this second input connection, which goes to a negative summation input. Finally, a feedback path couples the circuit output to an amplifier input. In this path, the attenuation of the feedback network is Z₁/(Z₁+Z₂), which is the feedback factor. This feedback path connects to another negative summation input in the model, which corresponds to the inverting amplifier input connection of the circuit.

Analyzing the completed model produces a transfer response of the expected form:

$$A_{CLI} = \frac{(1-\alpha)/\beta}{1+1/\beta}$$

The denominator of this equation is the 1+(1/\beta) result common to all of the previous results. Thus, bandwidth and stability conclusions previously drawn from this denominator also apply to the equations for Figs 7 and 8. The closed-loop bandwidth is βf_c, and frequency stability conditions relate to the intercept of the A and 1/β curves of Fig 3. The expression for the ideal closed-loop gain for the Fig 7 and Fig 8 circuits is the numerator of the equation, (1-α)/β. Substituting the expressions for α and β in this expression shows that A_{CLI} = 1.

**Modeling extends simplicity**

You can readily extend the modeling principles of the preceding examples to any op-amp application. Using this approach, the final circuit analysis reduces to a single loop equation. Moreover, feedback modeling simultaneously defines many circuit-performance characteristics while avoiding the more complex response analysis of the circuit. You analyze the actual circuit only when questions arise about the validity of the feedback model. The three steps of feedback analysis are drawing the model, determining the α and β factors, and finding the transfer response.

Drawing the model centers on the op amp's differential inputs. Feedback or input-signal connections to the op amp's inverting input are drawn as connections to negative inputs on the model summation element. Connections to the op amp's noninverting input are drawn as connections to positive summation inputs. An α or β attenuator accompanies each of these input and feed-

The generalized feedback model covers each of the four possible input and feedback connections to the two op-amp inputs.

back connections. With just these polarity and attenuator guidelines, you draw the model itself. From the feedback networks, you find the individual \( \alpha \) and \( \beta \) terms as voltage-divider ratios. Feedback and feed-forward signals drive a given network from opposite ends, resulting in different divider ratios. You find the two corresponding ratios by using superpositioning to separate the effects of the feedback and feed-forward signals. Once you determine these ratios, the feedback model is complete.

Next, you analyze the model to determine the net feedback-factor of the circuit and to find the ideal closed-loop gain. For most op-amp configurations, you can read the individual \( \beta \) directly from the circuit. You read the individual \( \beta_- \) and \( \beta_+ \) factors from the voltage-divider ratios of the feedback networks. You can find the net feedback factor of the circuit from \( \beta = \beta_- - \beta_+ \). This step alone defines numerous performance errors as described for Fig 1. You can also find the bandwidth at this point through \( BW = \beta f_c \). Where \( \beta \) varies with frequency, the value of beta used to find the bandwidth is the value at the intercept of the A and \( 1/\beta \) curves.

To complete the process and find \( A_{CL} \), analyze the model for its transfer response. This step requires one loop equation, which describes the model summation times the open-loop-gain \( A \). Solving this equation for \( A_{CL} = \frac{e_1}{e_1} \) defines the transfer response of the circuit in terms of \( A \) and the \( \alpha \) and \( \beta \) factors. You then manipulate this result to arrange it in a standard form. The denominator of the \( A_{CL} \) result always reduces to the form \( 1 + (1/A\beta) \), and the resulting numerator is the ideal closed-loop gain, \( A_{CL} \). This standard-form requirement helps you detect analysis and modeling errors.

Complex circuit yields to modeling

To illustrate feedback analysis, consider the voltage-controlled current source of Fig 9 (Ref 3). Because of positive feedback, this op-amp connection produces an output current that is independent of the load voltage. The voltage load \( R_L \) develops acts as an input signal to the op amp's noninverting input. The amplification of this signal adjusts the op amp's output voltage by an amount that accommodates the load voltage. The added output voltage supplies a correction current through the positive feedback network \( R_2/n \) and \( R_2 \) form. This current accurately compensates the effect of the load voltage as long as you establish the illustrated 1:1/n resistor ratios.

The Fig 9 circuit is well known, but its performance characteristics are not obvious. The circuit structure offers little insight into its bandwidth and the effects of input error signals. The voltage swing at the amplifier's output due to input and load voltages is not apparent. Furthermore, the circuit's positive feedback raises the question of frequency stability. Straightforward analysis of all these performance characteristics is a formidable task.

Feedback modeling reduces the task to one loop equation through the information you derive from the feedback factor and closed-loop response. Fig 10 shows the feedback-analysis circuit of Fig 9. This format displays positive and negative feedback factors through voltage dividers. To model the Fig 10 circuit, you include positive and negative feedback paths around the gain block. These paths meet summation-element inputs bearing the same signs as the corresponding amplifier inputs in the circuit. The model couples input signal \( e_1 \) to the summation element through an \( \alpha \) block, which represents the attenuation of the feedback network \( e_1 \) drives.

To define the \( \alpha \) and \( \beta \) terms, take the corresponding voltage-divider ratios from the circuit diagram. For the circuit of Fig 10,

\[
\alpha = \frac{1}{1+n}, \quad \beta_+ = \frac{n}{1+n}, \quad \beta_- = \frac{nR_2}{R_2+(1+n)R_L}
\]

Fig 9—A complex feedback structure confuses calculation of circuit performance for this well-known current source.
FREE $25 TRACK/HOLD & REF WITH EVERY 12-BIT A/D

For $17* Get a 12-Bit A/D plus a Track/Hold & a Voltage Reference in a Small Footprint DIP or SO Package

Design in the Maxim MAX163 Family of complete single-chip A/D converters, and eliminate multi-component design problems, such as slew-rate limitations, settling time delays, signal droop, hold-step errors, and noise/distortion. Also, save board space, design time, and cost.

- 8.33 µs Conversion Time
- 12-Bit No Missing Codes
- 100kHz Sampling Rate
- DC and Dynamic Specs 100% Tested
- 1 µs Acquisition Time Track/Hold
- 25ppm/°C Voltage Reference
- High Input Resistance (500MΩ)
- Analog Input Range: MAX163-0V to +5V, MAX164 ±5V, MAX167 ±2.5V
- Pin Compatible with AD7572

MAX167 Replaces AD7572 and Sample/Hold

Pin compatible with the AD7572, Maxim's MAX163 Family can plug into existing sockets and eliminate an external sample/hold and a high performance amplifier. Unlike other A/Ds with low-resistance inputs, the high input resistance (500MΩ) of Maxim's converters allow the use of a lower cost amplifier to drive the A/D input. Compare the MAX167 specs to an AD7572KN05 used with an external sample/hold and see how well Maxims's performance looks — at a lower cost.

Using feedback modeling, you can derive the frequency characteristics of an op-amp circuit by analyzing the model's closed-loop response equation.

You find the net circuit feedback factor from

\[ \beta = \frac{R_2}{R_2 + (1 + n)R_L} \beta \cdot \]

Generalized results define performance

With this simple analysis, you know the bandwidth, stability, and effects of amplifier errors for the Fig 9 circuit. The resistance values yield a \( \beta \) of 0.076. As a result, the circuit bandwidth at \( f_c \) is a small part of the available amplifier bandwidth. For the OPA111, \( f_c = 2 \text{ MHz} \), and the circuit's bandwidth is 152 kHz. Even less bandwidth results with higher values of load resistance. As the \( \beta \) equation shows, the net feedback factor decreases to zero as \( R_L \) becomes very large.

For Fig 9, an increase in load resistance from 1 to 10 k\( \Omega \) reduces the circuit bandwidth from 152 to 16 kHz. Normally, the values of \( R_1 \) and \( R_2/n \) would suggest a low-gain circuit for which the bandwidth would approach that of \( f_c \). However, an almost equal \( \beta \), counteracts the near-unity \( \beta \), and the resulting feedback demand for amplifier gain is high.

The frequency-stability information revealed by the \( \beta \) equation is twofold. First, the equation shows that \( \beta \) is always a positive value, indicating that negative feedback prevails regardless of the load resistance. Otherwise, the positive feedback could have dominated the circuit to cause latching or oscillation. The \( \beta \) equation provides further stability information through graphical analysis. Oscillation can still result if \( R_1 \) is an inductive load, such as that of a motor. In this case, the load impedance rises with increasing frequency, causing a corresponding decrease in \( \beta \). This decreasing \( \beta \) would cause the 1/\( \beta \) curve of Fig 3 to rise with frequency. The increased 1/\( \beta \) slope signifies greater phase shift in the loop at the intercept of the 1/\( \beta \) and \( A \) curves. This increased feedback phase shift signifies potential response ringing or even circuit oscillation. To retain stability in these cases, bypass the load with a capacitor.

The \( \beta \) equations also show the effects of amplifier input errors on the Fig 9 circuit output current. As with all op-amp configurations, the input-referred errors \( e_{ID} \) includes are first amplified by 1/\( \beta \). This amplification determines the error effects at the op amp's output. From this output, the positive feedback network feeds back the errors through an attenuation factor of \( \beta_+ \). This attenuated signal is across load \( R_L \) and develops an output error current of (\( \beta \cdot 1/\beta \cdot e_{ID}/R_L \)). Typically, \( \beta_+ \cdot 1/\beta \) is large, and the effects of \( e_{ID} \) are amplified in the load current. For the components of Fig 9, \( \beta_+ \cdot 1/\beta = 11 \), which is the gain the circuit applies to the errors of \( e_{ID} \) before those errors appear across \( R_L \).

Continuing the model analysis yields the Fig 9 transfer response. You derive the current-output response from the input-to-output voltage response, \( e_i/e_o \). Using

Fig 10—Translating the Fig 9 circuit into a feedback-analysis circuit (a) and then a feedback model (b) simplifies analysis and extends performance insight through standardized feedback results.
WORLD'S LOWEST COST
12-BIT 3µS A/D

The Next Industry Standard for Only $15.00*

For applications demanding blazing speed and low cost, Maxim offers the new MAX183, the lowest-cost 3µs 12-bit A/D ever! Built with a proprietary BiCMOS process, the new A/D provides high speed and low code-edge noise, while consuming only 90mW of power. For applications that don’t require 3µs conversion times, Maxim offers the 5µs MAX184 and 10µs MAX185, two new lower-priced ADCs that are otherwise identical to the MAX183.

♦ ±1/2LSB Max Integral Nonlinearity
♦ "No Missing Codes" Performance Over Full Operating Temperature Range
♦ 100ns Max Data Access Time and Three-State Data Outputs for Parallel Microprocessor Interfaces

Simplify Your Design

The MAX183 reduces design complexity and time with flexible +5V, +10V, or ±5V input ranges and an internal reference buffer that allows one system reference to drive multiple ADCs. The A/D works with an external voltage reference, so you can choose the optimum one for each application.

♦ Flexible +5V, +10V, ±5V Input Ranges
♦ Operates with +5V, and -12V or -15V Supplies
♦ Drive A/D from a Crystal or an External Clock Source
♦ Small-Footprint 24-Pin DIPs and SOICs

FREE A/D Converter Design Guide

Includes: ♦ Application Notes ♦ Data Sheets ♦ Cards For Free Samples

EDN June 20, 1991
CIRCLE NO. 110

© 1991 Maxim Integrated Products.
Frequency plots let you evaluate the frequency stability of an op-amp circuit from the A and 1/β curve slopes.

the Fig 10 model, you find \( \frac{e_0}{e_1} \) from a single loop equation that you then reduce to standard form. From the model, \( e_0 = A(-ae_1 - \beta - e_0 + \beta e_0) \). Solve this expression for \( A_{CL} = \frac{e_0}{e_1} \) and manipulate the result to develop the standard denominator of \( 1 + (1/A\beta) \). For Fig 10,

\[
A_{CL} = \frac{e_0}{e_1} = -\frac{\alpha/\beta}{1 + 1/A\beta}.
\]

You then translate this result to a current output by first noting that the load voltage equals the positive feedback signal, or \( e_L = \beta e_0 = i_LR_L \). Solving this equation for \( e_0 \) and substituting the result in the \( A_{CL} \) equation yields a Fig 9 response of

\[
\frac{i_L}{e_1} = \frac{-1/R_L}{1 + 1/A\beta}.
\]

Generalized model covers all

Drawing and analyzing feedback models adds insight to op-amp circuit operation and works with any op-amp application. However, op-amp circuit analysis is even simpler with a generalized feedback model and standard response equations. These standardized results avoid even the single loop equation of the model analysis and hold for all practical applications. Op-amp circuit analysis then reduces to finding voltage-divider ratios, which you can generally determine by inspection.

The feedback model of Fig 11 represents all possible op-amp circuit configurations. This model includes input and feedback connections to both the positive and negative summation inputs. The separation between the possible and the practical excludes op-amp configurations that have no end value.

The Fig 11 model represents each of the four possible input and feedback connections to the two op-amp inputs. Most op-amp configurations do not use all of these connections. In these cases, you set the associated \( \alpha \) or \( \beta \) terms to zero. Similarly, many op-amp applications have direct input or feedback connections to the op-amp inputs. In these cases, a network does not attenuate the related signals, and you set the associated \( \alpha \) and \( \beta \) terms to unity. For example, the Fig 10 circuit has no input-signal coupling to the op amp's noninverting input. This lack of input-signal coupling sets \( \alpha_+ \) to zero, and the Fig 11 model reduces to the model in Fig 10. Similarly, the Fig 8 circuit has no feedback coupling to the op amp's noninverting input, and the input signal connects directly to this input. In this case, \( \beta_+ = 0, \alpha_+ = 1 \), and the generalized model reduces to the model in Fig 8.

Analyzing the generalized model yields standardized equations that also lend themselves to specific op-amp applications. For the model of Fig 11,

\[
A_{CL} = \frac{e_0}{e_1} = \frac{\alpha/\beta}{1 + 1/A\beta} = \frac{A_{CL}}{1 + 1/A\beta} \quad (5)
\]

\( \beta = \beta_- - \beta_+ \).

This analysis immediately communicates three results common to all op-amp configurations. First, the net feedback factor of the circuit is \( \beta = \beta_- - \beta_+ \). In all cases, the differential inputs of the op amp subtract one feedback signal from the other. Next, the denominator of the \( A_{CL} \) equation is the familiar \( 1 + (1/A\beta) \). Thus, the bandwidth and frequency-stability conclusions drawn using this denominator still apply. As in Fig 3, the intercept of the 1/\( \beta \) and A curves sets the Fig 11 bandwidth \( BW = \beta f_c \). Frequency stability relates to the curve slopes at this intercept, as also described for Fig 3. Finally, the numerators of Eq 5 show that the ideal closed-loop gain is \( A_{CL} = \alpha/\beta \) regardless of the op-amp configuration. Because of the denominator form of Eq
Murata Erie Components. A Perfect Fit For Power Supplies.

Around the world and in thousands of high voltage and miniaturized power supply designs, Murata Erie electronic components are proving to be the perfect match in meeting today's most critical production and performance requirements.

From ceramic disc and high voltage capacitors to trimming potentiometers and high voltage resistors. From EMI/RFI filters and NTC thermistors to focus controls and a myriad of SMD devices including chip monolithic capacitors. Murata Erie has your power supply solution available today, off-the-shelf. And, approvals include UL, CSA, VDE, SEV, SEMKO, BS and more.

Our position as the world's leading manufacturer of electronic components is your assurance of on-time delivery, competitive pricing, product availability and ship-to-stock quality. You can also count on the support of Murata Erie's uniquely qualified applications engineering staff.

It's this type of commitment that has forged a solid reputation with those who design and build power supplies. And it's why you'll find Murata Erie's components the preferred choice for even the most sensitive medical, industrial, commercial and military electronics systems.

For technical information write to Murata Erie North America, 2200 Lake Park Drive, Smyrna, Georgia 30080 or call 404-436-1300. To order literature call 1-800-831-9172.
You can write the transfer response of any negative-feedback op-amp system in a form that includes the $1 + 1/(A\beta)$ denominator.

For the model, consider an input error source, $-e_{im}$, directly coupled to a positive summation input. This addition indicates that the amplifier input errors are in series with the input circuit. With the $e_{im}$ source connected to the model, analysis shows that Fig 11 amplifies input-referred errors by the same gain described earlier.

Omron optical switches keep an eye on innovation. They work by sight rather than touch. Which means they won't wear out like electromechanical switches in tough applications such as duplicating, fax machines and computer peripherals. In fact, our optical switches operate thousands of times faster than electromechanical switches. And, they perform reliably for up to twenty years or more, exceeding the lifetime of the product itself.

Omron's optical switches dramatically improve the reliability of your end product by virtually eliminating switch failure. Take a closer look at Omron optical standard types to choose from. You can reach us at 1-800-62-OMRON.

Omron optical switches keep an eye on innovation.
New LTC 1290 A to D System on a Chip.

Linear Technology presents the LTC1290, the new standard in serial 12-bit data acquisition solutions. With exceptionally stable accuracy over temperature, the LTC1290 includes an 8-channel MUX, S/H, and ADC all in one low power CMOS design. Normal power consumption is a mere 25mW, and its design includes a software selectable shut down that reduces consumption to microwatt levels.

And the LTC1290 is pin and function compatible with the LTC1090. That means that you can upgrade from 10-bit to 12-bit resolution and accuracy with a simple part change and little or no software modifications.

The LTC1290’s efficient serial I/O allows easy interface to virtually any microprocessor and is ideal for remote or electrically isolated applications. The 50kHz throughput rate and S/H acquisition time of less than 1 microsecond make digitizing higher frequency waveforms easy. Software configurability of the MUX and analog to digital converter provide unmatched functional flexibility. The LTC1290 operates from either a single +5V supply for 0 to 5V inputs or ±5V supplies for -5V to +5V inputs and is available in 20 pin skinny DIP or SO packages.

Pricing for the LTC1290 commercial grade plastic device starts at $15.95 in 100’s. Take a hard look at the new LTC1290. We think you’ll agree, it’s the high performance 12-bit ADC solution to your data acquisition needs.

*50µW in shutdown
Diode sensor compensates laser

Gheorghe Stoenescu and Neculai Grosu
Institute of Atomic Physics, Bucharest, Romania

Laser-receiver circuits must bias their avalanche photodiodes (APD) to achieve optimal gain. Unfortunately, an APD's gain is dependent on the operating temperature. The circuit in Fig 1 controls the operating voltage of an APD over a large temperatures range to maintain the gain at the optimal value. The circuit uses D₁ as a temperature sensor thermally matched with the APD.

A voltage regulator, IC₁, supplies the necessary reference voltage to the circuit. IC₂A and Q₁ bias D₁ at a constant current. IC₂B, IC₂C, IC₃A, IC₃B, and IC₃C amplify D₁'s varying voltage and set Q₂ to the optimal gain corresponding value. Potentiometer R₁ controls the amplification over a range of 5 to 15. R₂ controls the voltage level, which corresponds to the optimal gain of the APD at 22°C (the temperature is specific to the type of APD).

Fig 1 was tested with an RCA C30954E APD. The tests covered the -40 to +70°C temperature range and used a semiconductor laser. The laser radiation was transmuted on the APD's active surface in the climatic room via an optical-fiber cable. The gain varied by at most ±0.2 dB over the entire temperature range.

To Vote For This Design, Circle No. 746

---

**Notes:**
IC₂ AND IC₃ = M324

**Fig 1—**This circuit controls the operating voltage of an avalanche photodiode over a wide range of temperatures by using D₁ as a temperature sensor.
Auxiliary supply tracks power factor

Bill Andreyckak  
Unitrode Integrated Circuits Corp,  
Merrimack, NH

Most power-factor-correction circuits use a boost converter to generate a regulated dc output voltage from the ac line input while forcing the load to draw sinusoidal current, thereby maximizing the power factor. Typically, these circuits use an additional winding on the boost inductor (Fig 1a) to supply power to the control circuit. Unfortunately, the voltage across the inductor varies with the line voltage during both the charging and discharging period. A crude arrangement that uses a limiting resistor to feed a storage capacitor in parallel with a zener diode works well enough at very low power levels, but is inefficient and bulky at higher levels.

Fig 1b's circuit full-wave rectifies the auxiliary winding's output to completely cancel out line variations and provide a regulated output voltage. The circuit essentially sums the two phases of the boost inductor's voltage to eliminate the 120-Hz components. The regulated output tracks the power-factor-controlled preregulator output voltage and can be used in the corrected output voltage's feedback loop.

An isolated auxiliary winding consists of the desired number of turns wound on the boost inductor. You can vary the exact value of the auxiliary supply's output voltage by adjusting or scaling the auxiliary winding's number of turns. Fig 1b's rectifier develops two separate but individually unregulated voltages across capacitors C1 and C2. Each of these voltages varies in amplitude at twice the ac line frequency. When switch Q1 is on, the boost inductor connects directly across the input supply, and a voltage proportional to the instantaneous input voltage develops across capacitor C1. Once the switch turns off, the inductor voltage reverses and clamps to a voltage equal to VOUT - VIN. During this interval, a voltage proportional to VOUT - VIN develops across C2. The sum of these two capacitor voltages produces a regulated auxiliary voltage proportional to VOUT. The voltage across the output capacitor equals VIN + (VOUT - VIN), thereby canceling the input-line variations. EDN BBS/DL_SIG #971

Model helps determine motor parameters

Patrick H Conway  
Conway Consultants, Rancho Palos Verdes, CA

By modeling a dc motor as a voltage-controlled oscillator, you can determine a servo motor's parameters for your particular load conditions. Fig 1a is a diagram of a motor and load with a tachometer. EA is the applied armature voltage, and ωM is the motor speed in rad/sec. The output frequency, ωOUT, equals ωM × N, where N is the number of slots on the tachometer wheel. The standard motor terms are the torque constant, KT; the moment of inertia, J; and the viscous-friction coeffi-

DESIGN IDEAS

cient, f. Neglecting the armature resistance, $R_A$, and inductance, $L_A$, the motor's transfer function is

$$\frac{\omega_{\text{out}}(s)}{E_A(s)} = \frac{NKf}{s+1}.$$ 

Because the steady-state speed is proportional to the applied voltage, and the step response is exponential—one pole in the transfer function—you can use a VCO with a lowpass filter at its input to represent the motor and load (Fig 1b.) Time constant $\tau_M$ equals $R \times C$ in seconds, and gain constant $K_M$ equals the steady-state speed divided by $E_A$ in units of rad/sec/V. $N$ is identical to that of Fig 1a. Thus, you can characterize the motor and load using $\tau_M$ and $K_M$. Fig 1b's transfer function is

$$\frac{\omega_{\text{out}}(s)}{E_A(s)} = \frac{N K_M}{\tau_M s + 1}.$$ 

The time to reach 50% of the motor's steady-state speed after applying a step input voltage is $0.69 \tau_M$. You can track this time with the second hand of a watch while monitoring the output with a frequency counter. For a motor speed of 3600 rpm and a tachometer with 400 slots, $\omega$ equals 150.8k rad/sec (24 kHz). The coefficients of corresponding terms in the two transfer functions are related as follows: $K_M/f = K_M$ in rad/sec/V, and $J/f = \tau_M$ in seconds.

Fig 1—By modeling a servo motor and load (a) as a VCO and RC filter (b), you can solve for coefficients that let you derive a coefficient of friction, $f$, and moment of inertia, $J$, that correspond to your motor's load conditions.

The combined mechanical parameters of the motor and load are $K_T$ (unchanged because the load does not influence it), $f = K_T/K_M$, and $J = f \times \tau_M$.

Spice model aids loop-gain analysis

Henry Yiu
Perkin Elmer Corp, Pomona, CA

To plot the gain-phase relationships of a closed-loop feedback network using Spice, you must break the loop and inject an input signal. When you open the loop, proper dc bias is difficult to maintain because the open-loop dc gain is usually very high. Accounting for the opened loop's input and output impedances is also difficult. For instance, the input capacitance of an op amp could be in a separate library file that is inaccessible to the user. Models that approximate forward- and reverse-loop gain let you maintain the proper dc bias when the loop is open.

Fig 1 shows the general ac model for any 2-port open-loop network. The parameters $E$, $F$, $R$, and $Y$ can be any functions of the complex frequency, $S$. The correct way to calculate the loop gain is to close the loop by making $V_1 = V_2$ and $I_1 = I_2$ and then open the loop at the dependent sources.

The forward-loop gain, $FLG$, is the voltage gain from the dependent voltage source around the loop and back:

$$FLG = E \cdot \frac{1-F}{1+RY-F}.$$
Alongside microcomputers and the cashless society, the demand for magnetic card technology is rapidly increasing in a vast range of industries. One factor behind this greater use of magnetic cards is the miniaturization of equipment, including telephones, door security systems (hotels, etc.) and POS terminals. But not all systems are the same. That's why you need to check out the standard before choosing a card reader system. And that means TOKIN.

Fast, efficient information handling means a greater demand for compact, low-power magnetic card readers capable of reading information from various magnetic strips. TOKIN meets this demand by using the latest breakthrough IC in its new ultra-compact MCS Series Manual Magnetic Card Reader. The unit's remarkably small size offers maximum leeway in equipment design.

Apart from the MCS-180 Series, TOKIN offers a complete lineup of reliable, economical Magnetic Card Readers.

**Features**
- New IC makes for super-small size, superior reading ability and reduced electric consumption
- Patented tension bar provides improved head stability and outstanding reading accuracy
- Magnetic head can be selected from TOKIN's extensive lineup of magnetic materials

**Applications**
- Handy order terminals (for restaurants)
- Communications equipment terminals
- POS terminals
- Door security (for hotels, etc.)
- Various other systems

**Shapes and Dimensions**
Likewise, the reverse-loop gain, RLG, is the current gain from the dependent current source around the loop and back:

$$RLG = F \cdot \frac{1 - E}{1 + RY - E}$$

Depending on where you break the loop, E, F, R, and Y vary, but FLG and RLG stay constant.

Fig 2 shows Spice models that approximate FLG and RLG. The models maintain proper dc bias by simulating a closed-loop dc operating condition and using dependent sources that are active only at dc. PSpice’s (MicroSim Corp) behavioral modeling features let you simulate this operating condition. When the program initiates an ac simulation, all circuit elements linearize around the bias point so that the output will never saturate, even with a large loop gain. The ac open-loop network is therefore equivalent to the general model of Fig 1.

The voltage outputs of the FLG and RLG models are as follows:

$$FLG' = E \cdot \frac{1}{1 + RY}$$

$$RLG' = F.$$

Listing 1 (which you can also obtain from the EDN BBS’s DI Special Interest Group (617-558-4241, 300/1200/2400,8,N,1—from main menu, enter (s)ig,<s/di_sig>, rk972)) contains the PSpice code for these models. To use the models, make the open-loop network under test into a subcircuit named OLN, which you then run as a PSpice model. If $|RLG'| > BF < 1$, then FLG’ closely approximates the loop-gain term, FLG. Otherwise, break the loop at a different point and run the analysis again.

Note that these models are based on the assumption that $1 + RY$ does not approach zero. Because $1 + RY = V3/V2^2$ in Fig 2a, you can use PSpice’s probe feature to verify that $1 + RY$ never approaches zero over all frequencies of interest. This check is not necessary unless, for example, you break the loop in the middle of a tuned LC network or a resonant transmission line. EDN BBS/DI_SIG #972

Reference
No "boomerang effect" at Trend Circuits.
Less than 1% of our prototype boards ever come back.

Fast turnovers in prototype circuit boards are great—but not when the boards circle back again and again because of poor quality.

That "boomerang effect" costs precious time in proving your concepts and can end your chances to meet critical market windows.

We deliver speed and quality.

Speedy turnovers don't count for much if prototypes don't work. At Trend Circuits, we're specialists in rapid production of prototype boards that work first time out. That's because we're people who understand your language, your objectives and your pressures.

Further, fully one-third of our people are involved in inspection. We begin with incoming artwork, where we can quickly identify common design errors. And we continue with double- and triple-checking right through to completion. As a result, less than a scant 1% ever come back. And that's good for both of us.

Now for speed. On a regular basis, we deliver double-sided boards within 24 hours, and multi-layer boards within five days. In fact, we're completing no less than 82% of all our work within five days.

Check our references.
You can verify our facts easily enough by talking to our customers. Simply phone and we'll put you in touch with people who've decided they won't accept compromise in quickly moving from design to finished prototype. They'll tell you why we're their logical choice for "no-boomerang" boards. And why we should be yours.

Low-battery detector polls threshold

Yongping Xia
Department of Electrical and Computer Engineering, West Virginia University, Morgantown, WV

The battery low-voltage detector in Fig 1 uses a CD4093 Schmitt trigger, a capacitor that acts as a 1-bit dynamic RAM. The circuit conserves power by using a periodic test method. IC1A, C1, R1, R2, and D1 generate a narrow, positive pulse at point A. The duty cycle of this pulsed signal depends on the ratio between R1 and R2. When the signal at A is high, the voltage at this point almost equals that of the power supply because IC1A is a CMOS device.

D2, R4, and R5 regulate and divide the signal at A. Thus, the input of IC1B is independent of the power supply. Because the threshold voltage of the Schmitt trigger depends on the power supply, the threshold voltage will drop if the power-supply voltage drops. When the threshold voltage is lower than the input voltage, IC1B will go low, and IC1C’s output will go high. Otherwise, IC1C will always be low.

Capacitor C2 stores the results of the periodic test. The time constant C2 and R6 set is 1 sec, and the test period is approximately 0.1 sec, so point B holds the test result between successive tests. When point B is high, which implies that the battery is low, IC1D, C3, and R7 generate a square waveform, which lights D3. You can adjust the detected voltage level by adjusting R4. You can test different battery voltages by changing the voltage level of D2.

Fig 1—Capacitor C2 acts like a 1-bit dynamic RAM by storing the result of this periodic battery tester.
THIS MAN WAS unhappy. THEN HE BOUGHT AN EMULATOR AND NOW HE'S miserable. Funnily ENOUGH WE CAN SEE WHY.

- IF THIS MAN HAD CHOSEN ORION's UniLab™ 8620, HE WOULD HAVE GOTTEN AN EASY-TO-USE, AFFORDABLE DEBUGGING TOOL THAT WORKS WONDERS ON OVER 170 DIFFERENT PROCESSORS.
- INSTEAD HE CHOSE ANOTHER COMPANY'S EMULATOR, A MORE EXPENSIVE ONE. AN EMULATOR WITH EVEN MORE BUGS THAN HIS OWN DESIGN.
- THE WHOLE SITUATION MAKES HIM WISH HE'D LISTENED TO HIS MOTHER AND GONE TO LAW SCHOOL.
- BUT MORE THAN ANYTHING ELSE, IT MAKES HIM WISH THERE WAS SOME WAY, SOMEHOW, TO GET OUT OF THIS JAM WITHOUT SPENDING A FORTUNE OR WORKING ENOUGH OVERTIME TO RUIN HIS MARRIAGE.
- THIS IS WHERE THE UniLab 8620 ANALYZER-EMULATOR SHOULD HAVE ENTERED THE PICTURE. IT'S A POWERFUL DEVELOPMENT SYSTEM THAT WOULD HAVE TAKEN HIM FROM START TO FINISH IN NO TIME, THANKS IN PART TO THE MANY FEATURES WE OFFER.
- INSTEAD OF PHONING THE OTHER EMULATOR COMPANY TO GIVE THEM A PIECE OF HIS MIND, THIS MAN WOULD HAVE PEACE OF MIND.
- BECAUSE THE UniLab 8620 IS BACKED BY 11 YEARS OF ORION EMULATION EXPERIENCE. AND COMPLETE SERVICE AND SUPPORT.
- SO DON'T MAKE THE SAME MISTAKE THIS MAN DID. CALL ORION NOW AND ASK ABOUT OUR RISK-FREE EVALUATION PROGRAM. WITH MORE EMULATION FOR LESS, YOU'RE CERTAIN TO FIND HAPPY HUNTING WHILE SEARCHING FOR THOSE MISERABLE BUGS.

Suggestion invokes tradeoffs

Thanks to Larry K. Baxter for his comments on the Design Idea “S/H circuit multiplexes op amp” in EDN’s Feedback and Amplification column of February 18, 1991. He suggests moving R1 outside the feedback loop to ensure stability in the op amp (although EDN published his wording as “... should be inside the feedback loop . . .”). However, stability wasn’t an issue for the op amp tested, an old 8007 from Intersil. Placing the resistor as Mr. Baxter recommends eliminates a potentially destabilizing phase shift but lengthens the acquisition time by increasing the capacitor-charging resistance. Readers who use other op amps may want to consider this tradeoff of stability vs acquisition time.

As to the left-hand analog switch, we haven’t converged on a clarification because that switch is drawn differently in all four schematics: the original author’s (a Maxim employee) version, my edited version, EDN’s published version (which doesn’t work), and Mr. Baxter’s version. The pole of that switch must connect to the op amp. It connects to VIN in EDN’s October 1, 1990, original version, which disconnects the op amp in hold mode. Mr. Baxter’s switch doesn’t identify the pole, though he may not have drawn it that way. In any case, we all agree that analog switches exhibit less leakage and capacitance on switched nodes than on the common node.

Engineers and magazine art departments could reduce such confusion by adhering to standard IEEE or EIA-approved symbols for electronic components.

Schematic Corrections

Please note two schematic errors that crept into the March 14, 1991, Design Idea “One coax cable carries video and power” by Jeff Kirsten and Charlie Allen. In Fig 2, Q2 should be a 2N3904, not a 2N3906. In Fig 3, the ground symbol at IC2 should be a triangle to indicate a power-supply ground.

CAPS is a CD-ROM-based productivity-boosting engineering tool that helps you find, select, and specify ICs and semiconductors.
The Right Choice Could Save You $25,000.

HTBasic from TransEra will turn your PC into a scientific workstation at a fraction of the cost. A real alternative to a high-priced dedicated workstation, a PC with HTBasic gives you the capabilities you need for complex scientific/engineering applications, while retaining compatibility to run and share data with standard PC software.

The savings don’t end with the workstation itself. With an HTBasic system, you can use industry-standard printers, graphic output devices, and networking systems. You get the flexibility you need to lay out the system you want without being tied to limited offerings from one supplier.

HTBasic is a state-of-the-art language which gives you a number of advanced scientific/engineering features not found in other BASIC packages.

Features such as data acquisition and IEEE-488/RS-232 instrument control syntax, COMPLEX arithmetic, matrix mathematics, complete HP-style graphics, a comprehensive on-line help facility, and many more, add up to increased productivity for levels of users.

The right choice for your next engineering workstation is a PC with HTBasic. Call or write us today for more information.

Micropower Low-Dropout Voltage Regulators
- Quiescent current is 130 µA
- Dropout voltage is 60 to 470 mV

Designed for use in battery-powered systems, the LP2952, LP2953, and LP2954 voltage regulators feature a quiescent current of only 130 µA at a 1-mA load. The devices have a dropout voltage that ranges from 60 mV at light loads to 470 mV at full loads of 250 mA. The LP2952 and LP2953 feature an adjustable output voltage of 1.23 to 29V; the LP2954 has a fixed 5V output. The LP2952 and LP2953 have error flags that indicate when the output voltage drops out of regulation; both devices also have a shutdown pin that you can wire to produce a quick turn-on and turn-off of the output voltage. The LP2953 also contains an auxiliary comparator that can be used for fault detection or low input-voltage warning. All of the regulators include reverse-battery protection, a feature that prevents the regulator from acting as a short circuit when the battery terminals are reversed. The LP2952 is available in 14-pin DIPs and 16-pin SO packages. The LP2954 is available in 14-pin DIPs and 16-pin SO packages. The LP2954 is offered in a 3-lead TO-220 package. $2 to $2.35 (100).

Video Conversion Chip
- Meets CCIR 601 standard
- Converts signals from YUV to RGB

Designed for use in the video-restitution stage of a digital image-processing system, the STV3300 chip converts YUV (luminance/chrominance) signals to RGB (red, green, blue) signals in accordance with CCIR 601 recommendations. A filter block provides 2× oversampling, which helps to eliminate noisy signals in digital receiver applications. Four selectable filters are available for chrominance signals, and one fixed filter is available for the luminance signal. Input data is in the 4:2:2 format defined by CCIR 601 and is fed through two 8-bit buses at 13.5 MHz max for the luminance and 6.75 MHz for the chrominance samples. RGB output data is on three 8-bit buses at 27 MHz max. The STV3300 comes in a 52-pin plastic leaded chip carrier. $18.20 (1000).

Image Digitizers
- Accelerate video-capture rate
- Provide high-resolution output

Featuring video-capture rates to 30M samples/sec, a trio of image digitizers can digitize NTSC video signals at 8 times the subcarrier frequency. This capability simplifies the design requirements of antialiasing filters. The three parts are the Bt218 8-bit flash converter, the
Bt252 single-channel image digitizer, and the Bt254 3-channel image digitizer with color output format. The Bt218 contains 256 high-speed parallel comparators to digitize analog-input signals. An input range of 0.714 to 1.2V allows direct digitization of NTSC and CCIR video signals. The Bt252 for monochrome video signals contains an 8-bit flash A/D converter that supports four analog video outputs. A 256 x 8-bit RAM look-up table enables real-time image manipulation prior to data storage. The Bt254 contains three 8-bit video A/D converters, supports two separate 3-channel video-output ports, and generates 8, 15, or 24 bits of color information for each pixel. The Bt218 is available in a 24-pin DIP or a 28-pin plastic leaded chip carrier (PLCC); the Bt252 and Bt254 come in 44-pin PLCCs. Bt218, $10; Bt252, $33; Bt254, $40 (100).

CIRCLE NO. 125
Now just one chip does the work of many. Micro Linear's ML2035 and ML2036 are the industry's first integrated programmable sinewave generators. They're easily programmable from DC to 25kHz (ML2035) or 50kHz (ML2036). Each delivers better than ±.75Hz frequency resolution, and -45dB harmonic distortion.

Absolute error gain over the frequency range is better than ±.1dB. And the frequency reference of the sinewave output is derived from either an external crystal or clock input.

The ML2035 is housed in an 8-pin DIP while the full featured ML2036 is available in a 14-pin DIP or 16-pin SOIC.

At prices starting at $5.95, the low-cost ML2035 and ML2036 are the perfect single chip solutions to efficient, precise sinewave generation.

So whether your application is in telecommunications, modems, motor control, uninterruptible power supplies, or any other, call Al Tremain at (408) 433-5200. Or write to Micro Linear, Dept. SWG, 2092 Concourse Drive, San Jose, CA 95131.

And ask for your copy of our 1991 Data Book, too.
Here’s one reason that over half of all SCSI devices sold are NCR.

We created the market… and we still lead the way.

Meet NCR’s SCSI development team. In 1983, they gave the computer industry its first SCSI device. By providing easy connectability and significantly reducing time to market, a new product era was born.

Since then needs have changed. By combining our system skills, high-performance standard cell methodology, and in-house manufacturing, NCR has maintained its leadership role with innovative new ideas like the 53C700 product family. And the joint development of LADDR — a new architecture aimed at cutting the development time of OS/2 device drivers by 90%.

Today SCSI is becoming the leading I/O standard — adopted by industry giants like Apple, IBM, HP, and DEC. And no one is selling more SCSI chip level products than NCR. In fact, no one even comes close.
Here's another.

The NCR 53C700 SCSI I/O Processor…
So good, Electronic Design named it the product of the year.

"You can't tell a good SCSI chip just by looking at it…" and according to Electronic Design, NCR's 53C700 is the best there is.

The only third generation SCSI device on the market today, it concentrates all the functions of an intelligent SCSI adapter board on a single, smart and extremely fast, chip… for about 15% of the cost.

As the first SCSI I/O processor on a chip, the 53C700 allows your CPU to work at maximum speed while initiating I/O operations up to thousands of times faster than any non-intelligent host adapter. DMA controllers can burst data at speeds of up to 50 Mbytes/s. This new chip cuts down system time hookup to a fraction of what it has been.

Those are just a few of the reasons Electronic Design's “Best of the Digital IC's” award went to NCR's 53C700 last year.

And now the NCR 53C710!

For the complete story on the NCR SCSI product line featuring the new 53C710, as well as the upcoming SCSI seminars with the NCR SCSI Development Team, please call:

1-800-334-5454
Low-Power Read Channel IC
- Supports constant-density recording
- Handles data rates to 30M bps

Featuring a low-power CMOS design, the ATT91C010 read channel IC is targeted for small hard-disk drives. The device consumes a maximum of 225 mW in read mode and 255 mW in write mode. In the standby mode, power consumption is only 25 mW. The device handles data rates to 30M bps and supports multizone constant density recording, which increases disk-data capacity. Included in the device are an AGC circuit, a peak detector, an embedded servo demodulator, a write-compensation circuit, a data synchronizer, and a µP-programmable serial interface. An on-chip current-mode DAC permits accurate tuning of the PLL’s center frequency to facilitate the use of constant-density recording methods. The device is available in a 44-pin plastic leaded chip carrier or a 44-pin plastic quad flatpack. $18 (1000).

Dual Integrator
- Dynamic range is 120 dB
- Noise is only 10 µV rms

The ACF2101 dual integrator converts low-level signal currents to output voltages by integration, using either internal or external capacitors. The device, which contains precision 100-pF capacitors, interfaces directly to sensor outputs such as those from photodiodes and phototubes. Key specifications include a 120-dB dynamic range, 10 µV rms of noise, 100 fA of bias current, and only 0.1-pC charge transfer. The dual device accepts inputs from 0 to 100 µA. Outputs are -10 to +0.1V at ±5 mA. Nonlinearity is ±0.01% FSR max. The integrator, which requires 5 and -15V supplies, comes in 24-pin plastic DIPs and surface-mount SOIC packages. From $18 (100).

Burr-Brown Corp, Box 11400, Tucson, AZ 85734. Phone (602) 746-1111. Circle No. 356
Take This Opportunity To Meet Our Distinguished Panel

Ideal for Menu-Driven Applications
The PEP™ 4286 interactive flat panel display provides you with a complete touchscreen man-machine interface that is ideal for menu driven applications. PEP 4286 combines a full-dot DC gas plasma display with a highly reliable infrared touchscreen switch matrix.

Exceptional LAB-6™ Brightness... Even in Sunlight!
The display’s LAB-6™ cathode coating provides a brightness level of 200L before filtering, and unsurpassed contrast. PEP 4286 can be used in high ambient light applications. This coating also allows the display to be used over a wide -20 to +75°C temperature range.

Complete Touchscreen Sub-system
As a complete touchscreen sub-system, the module includes a drip proof, polycarbonate bezel which seals to your front panel, a circular polarized filter which has two side areas for fixed function switch legends, and a rear chassis cover. 14K bytes of battery backed CMOS RAM is built-in for canned messages.

Ergonomically Distinguished
• User friendly touchscreen input
• Minimize training time and errors with menu driven input choices
• Bell output for touch confirmation
• 200L brightness is software-dimmable in 6 steps for comfortable long term viewing
• IR switch matrix means a clear, sharp display without distorting overlays
• Dedicated fixed function switch areas for most commonly used functions

Economically Distinguished
• Complete subsystem simplifies your design process and minimizes your time-to-market
• Replace banks of switches and dials with soft keys
• Display and touchscreen self-test speeds up QA and in-field diagnostics
• Compact flat panel is only 3* deep—fits where CRTs can’t
• Battery backed canned message RAM reduces host memory overhead

Display Features
• 240×120 accessible dots form a 12 line by 40 character display, using a nominal 5×7 dot matrix character
• 96-character U.S. ASCII character set in regular height-width, double height, double width, double height-width; all in regular and reverse video
• 96-character ISA Graphics character set
• 14.10×7.85×3.00” (W×H×D)

Operation
• Requires only +5.0VDC TTL supply and an unregulated 11-29VDC panel supply
• Serial I/O RS-232-C (with CTS and DTR) and RS-422 interfaces at 1200 or 9600 baud
• ANSI-standard VT100 compatible control codes

Circle No. 3 For Immediate Response
Circle No. 4 For Future Reference
**10 Base-T Transceiver**
- Implements IEEE-802.3 standard
- Includes polarity detection

The NE86C92 transceiver implements the IEEE-802.3 10 Base-T standard, which specifies a 10M-bit/sec Ethernet LAN using unshielded twisted-pair wiring. Among the transceiver's functions are polarity detection/correction, a smart squelch circuit, a crystal-controlled oscillator, and on-chip LED drivers for status indication (transmit, receive, polarity reversal, collision, and jabbing). The transceiver allows automatic selection between the 10 Base-T transceiver and the AUI (attachment unit interface). The AUI lets you change jumpers when switching between twisted-pair wiring and a remote medium-access unit, without removing the interface card. The transceiver has a typical current drain of 20 mA without traffic and 65 mA with heavy traffic. $12 (100).

**Signetics, Box 3409, Sunnyvale, CA 94088. Phone (408) 991-2000. Circle No. 357**

**Three-Phase Motor Drivers**
- For 12V disk-drive spindle motors
- Provide 3 and 4A outputs

The A8922 and A8925 motor drivers provide control and drive for 3-phase brushless dc motors in cartridge-tape and hard-disk drives, respectively. The 8925, which drives 12V spindle motors, has an output-current rating of 4A to accommodate faster up-to-speed times. A DMOS sense-FET output structure with an on-resistance of just 0.25Ω extends the head room at high output currents. To control spindle speed, the 8925 employs an on-chip transconductance amplifier that linearly regulates output current in proportion to an external control voltage. On-chip current sensing eliminates the need for external components, and internal control circuitry provides brake, disable, and tachometer functions, and the sequencing of the output drivers. Similar to the 8925, the 8922 has an output-current rating of 3A. Both devices accept Hall-effect inputs for motor commutation. The 8925 and the 8922 come in 44-lead and 28-pin plastic leaded chip carriers, respectively. 8925

**We've Made A Big Change In**

**Introducing The MD-11.**

You'll now notice a difference in American's service from San Jose to Tokyo. It's called the MD-11. A roomy new aircraft specifically designed for long-range flights. • American will still offer the only nonstop service to Tokyo from the San Jose/Silicon Valley area. We'll continue to offer nonstops to Tokyo from Dallas/Fort Worth as well. And, along the way, you'll still enjoy our

Schedules subject to change.
unit, $8; 8922 unit, $7.50 (1000).

Allegro Microsystems, Box 15036, Worcester, MA 01615. Phone (508) 853-5000. FAX (508) 853-5049. Circle No. 358

**Variable Gain Block**

- **Gain-control range is 50 dB**
- **Small-signal bandwidth is 200 MHz**

Used as an analog building block, the EL2082 2-quadrant multiplier provides 50 dB of variable gain control. The device operates in current mode rather than voltage mode, thus reducing input impedance and increasing output impedance. Targeted at high-frequency applications, the device features a small-signal bandwidth of 200 MHz and a large-signal bandwidth of 150 MHz. The device operates from ±5 to ±15 V supplies. When used with an external op amp, the multiplier’s differential gain is 0.05%, and differential phase is 0.025°. In the disable mode, the device has 80 dB of isolation at 10 MHz. The EL2082 is available in 8-pin DIPs and SOIC packages. $5.95 (100).

Elantec Inc, 1996 Tarob Ct, Milpitas, CA 95036. Phone (408) 945-1323. Circle No. 359

**Fast-Settling Op Amp**

- **Settles to 1 mV in 340 nsec**
- **Slew rate is 80V/µsec**

The LT1122 op amp features a typical settling time of 340 nsec and a guaranteed maximum settling time of 540 nsec, 100% tested to 1 mV at the sum node with a 10V input step. The op amp also features a typical slew rate of 80V/µsec (60V/µsec min). Internally compensated for unity-gain stability, the op amp has a small-signal bandwidth of 14 MHz and a large-signal (20V p-p) bandwidth of 1.2 MHz. Total harmonic distortion is only 0.001%. The JFET input op amp also features high precision. Input offset voltage is 600 µV, input-bias current is 75 pA, and input-offset current is 40 pA, all 100%-tested maximum values. The op amp is available in 8-pin SO packages, and in plastic and hermetic DIPs. $2.50 (100).

Low Profile PCB Solderable Interconnects
• Solders to the PC Board
• Impedance matched
Meritec's low profile, impedance matched PCB Solderable Interconnects can be terminated to a variety of different cable types.

Circle No. 168

High-Performance Interconnects That Terminate High Cost.

Meritec has terminated the high cost of high performance interconnects for fast logic applications. We produce a full line of cabl assemblies for applications in the 3ns to sub nanosecond range—engineered to match your requirements for controlled impedance and propagation rate while minimizing crosstalk. We deliver assemblies of unparalleled quality. On time. At a very reasonable price.

Our complete line includes Single Signal Interconnects (SSI™), Shielded Performance Interconnects (SPI™) and Multi Signal Interconnects (MSI™), terminated to a diversity of controlled impedance cables, including coax, twin coax, FEP, PTFE and our Filatex™ textile cable.

Call Meritec today at 216-354-3148 for more information and a free copy of our capabilities brochure.

Single Signal Interconnects offer high performance in a subminiature package
• Controlled impedance
• Low crosstalk
Meritec's economical 1x2 and 1x3 Single Signal Interconnects (SSI™) are engineered to match application requirements for controlled impedance and propagation rate while minimizing crosstalk. A spring latch connects the termination to the housing or to Meritec's Single Signal Carrier Systems (SSC™), which allow group interfacing with single, dual or triple row headers. Precision, high strength molded terminations provide reliability in critical applications. Boxed contacts with thermo resistance welding provides the ultimate in electrical continuity.

Circle No. 168
OrCAD has introduced the greatest product upgrade in its history. Memory limits, design restrictions, even boundaries between products are all disappearing.

For years, OrCAD’s competitors have been playing a game of catch-up. With the introduction of Release IV, the race is over. No one will match our price/performance ratio on these features:

- Schematic Parts Library has been increased to over 20,000 unique library parts
- Digital Simulation process has been speeded up by an order of magnitude
- Printed Circuit Board Layout package offers autoplacement and autorouting at no extra charge
- Expanded memory capabilities

Best of all, OrCAD introduces ESP

ESP is a graphical environment designed specifically for the electronic designer. Software tools appropriate for different stages in the design process are now linked together to form a seamless flow of information. This easy-to-use framework relieves the designer of time consuming tasks and the inconvenience of moving from one tool set to another. You can now spend more time productively designing.

For more information . . .

You need to know more about Release IV and all of the benefits OrCAD has to offer. Call the telephone number below and we’ll send you a free demonstration disk.

For more information, call (503) 690-9881

LOWEST COST, FASTEST SERVICE, GUARANTEED QUALITY

Data Acquisition & Control

TE-158 Telephone Control Card:
Take total control over your telephone communication. Direct telephone line interface gives you control over line connect/disconnect, touch-tone decoding and encoding, and detects call progress. Set your computer to dial out automatically, to keep trying if busy signal, control voice synthesizer, tape recorder with complete in/out capability, FCC approved.

Relay Card:
8 individually controlled industrial relays. 3A at 120VAC, SPST.
RE-140: $142

8 Bit A to D:
8 Analog inputs.
0-5V, 20mV steps.
7500 readings/sec.
AD-142: $142

Temperature Sensor:
Range 0-200°F. 10mV/°.2° Resolution with AD-142.
TS-111: $12

Digital Input:
8 opto-isolated inputs. Read voltage presence or switch closures.
IN-141: $65

Latched Digital Input:
8 opto-isolated inputs. Each input individually latched to catch switch closures and alarm loops.
LI-157: $85

Smart Quad Stepper Controller:
On board microprocessor controls four motors simultaneously. Uses simple commands like "MOVE ARM 10.2 (INCHES) LEFT". Set position, ramping, speed, units... Many inputs for limit switches etc. Stepper motors available.
SC-149: $299

FA-154 High Speed 12 Bit A/D Converter:
Blinding speed at low cost! Convert at 10 µs. Eight input channels accepting 0-5V signals. Special onboard variable gain amplifier lets you read signals less than 1LSB (1.2mv).
For value combined with speed in data acquisition and signal processing, this converter leads the pack!
FA-154: $179.00

Digital Output Driver:
8 outputs: 250mA at 12V. For relays, solenoids, stepper motors, lamps.
ST-143: $78

Odin Software:
PC compatible. Control relays from analog inputs or time schedules. Logging. Runs in background.
OS-189: $129

Reed Relay Card:
8 reed relays (20mA at 60VDC, SPST).
RE-156: $109

New

NEW

4 Channel 8 Bit D/A converter with output amplifiers.
DA-147: $149

D/A converter:
A/Bus 8 Bit D/A converter with output amplifiers.

32 Channel Multiplexer:
Switches up to 32 channels to a single common.
MX-155: $83

32 Channel Multiplexer:
4 Channel 8 Bit D/A converter.

Clock with Alarm:
Powerful clock/calendar. Battery backup.
CL-144: $98

A-Bus Adapters:
IBM PC/XT/AT & compatibles.
AR-133: $69

Serial Adapter:
Connect A-Bus systems to any RS-232 port. SA-129: $149

MicroChannel Adapter:
Parallel Adapters also available for Apple II, Commodore 64, 128, TRS-80.
AR-170: $93

Serial Processor:
Built in BASIC for off-line monitoring, logging, decision making.
SP-127: $189

COMPUTERS & PERIPHERALS

Noninterlaced Monitor
- Has a 248 x 186-mm viewing area
- Has a flicker-free refresh rate
The ViewSonic 6 is a true 1024 x 768 noninterlaced 14-in. ultra-VGA color monitor with a 248 x 186-mm display area. A multisynchronous unit, it automatically adjusts to horizontal scanning frequencies of 30 to 50 kHz and vertical frequencies ranging from 50 to 90 Hz. In the 800 x 600 pixel mode, the monitor has a 72-Hz (VESA (Video Electronics STandards Association) standard) flicker-free refresh rate and a 0.28-mm dot pitch. All access controls, including the presetting and auto-sizing functions, are located directly under the screen, making it convenient to switch between different screen modes. Controls include vertical and horizontal sizing, brightness, contrast, and centering. The monitor also has a tilt-and-swivel base. Operating in any IBM or compatible; MAC II; or Sony C1304 environment, the unit supports graphics standards including ultra-VGA, 8514/A, super-VGA, and VGA. $699.

Data-Storage Units
- Designed for the DSSI bus
- Interface with SCSI peripherals
This family of products is designed for the DSSI bus and offers MicroVAX 3XXX and VAX 4000 users the performance and capacity advantages of SCSI peripheral devices. The family includes three products—the DM/3000 and DM/4000 drive module kits, and the DH01 host adapter. The DM/3000 is designed to be mounted internally in the MicroVAX 3300 and 3400. It consists of a 5¼-in. drive integrated with the company's MD30 bridge controller, mounting hardware, and cables. The DM/4000 is available for the VAX 4000 and includes all the components of the DM/3000 plus an operator's panel. Both kits are available in 700M-, 1200M-, and 1600M-bit capacities. The DH01 is a Q-bus-to-DSSI host adapter for the MicroVAX, which has no DSSI port. It will function with either of the DM drive kits or with a DEC ISE. DM/3000, $6795 to $8895; DM/4000, $7095 to $9195; DH01, $2295 to $2495.

Laptop Modem
- Designed for the laptop market
- Requires no electrical outlet
Pocket Edition 2400 is a 3-oz, 3-in.-long modem designed specifically for the business traveler and the laptop market. It requires no electrical outlet, battery pack, or serial-port adapter to connect to a laptop or portable computer—it runs off the power supplied through the telephone line. The unit comes packaged with cables, Smartcom EZ communications software, and a carrying case. The modem is compatible with 2400-, 1200-, and 300-bps communications. The unit will also send faxes when used in conjunction with an information service like those offered by AT&T, MCI, US Sprint, Compuserve, or Genie. Smartcom EZ provides easy-to-follow menus and phone-book entries to store frequently called numbers. Keyboard macros, extensive on-line help screens, and Autotype, which enables users to transfer text files, are other features of Smartcom EZ. $179.

Keypad Encoder
- Is user configurable
- Designed for IBM compatibles

The USE144 user-programmable keypad encoder is designed for use with IBM PC/XTs or PC/ATs, compatible computers, or RS-232C devices. The unit is software configurable; both the keypad layout and keycode values can be changed by the user at any time. Interface type, baud rate, typematic period, and typematic delay are also software configurable. Using a utility program (Usecon), you can program all parameters. Usecon is menu driven and provides utility functions. The 144 works with matrix keypads and accommodates practically any pinout of rows and columns total 144 keys max. The encoder comes with two standard connectors—a right-angle header for the keypad and a straight header for all interface signals. The encoder operates from a 5V supply to provide true RS-232C compatibility. $145.

20-in. Monitor
- Fully IBM compatible
- Designed for high resolution applications

The Spectrum Autosync multifrequency monitor was designed to meet the most demanding high-resolution graphics and text requirements. It features a 20-in. dark tube to optimize picture quality in a wide range of applications including CAD/CAM/CAE, 3-D imaging, window applications medical, and desktop publishing. The unit is housed in a 56-lb plastic cabinet, which locates all controls at the user's fingertips. The unit is fully compatible with all IBM PC/XT, PC/AT, and PS/2 graphics including PGA, VGA, extended VGA, 1024 x 768, and 1280 x 1024 formats. The unit automatically adjusts picture size from horizontal frequencies of 29 to 66 kHz and vertical frequencies of 40 to 120 Hz. The unit comes with a universal-input power supply. $3195.

Controller Board
- Enhances VGA monitor resolution
- Includes an antialiasing feature

The MicroVGA 452 video controller board provides a resolution of 1536 x 1280 with a palette of 742,813
Now, up to twice the power of a standard battery.

Gates introduces two new rechargeables that are commanding everyone's attention: Nickel-Metal Hydride and ULTRAMAX™ Nickel-Cadmium batteries.

Ni-MH offers up to 100% more capacity than a standard Ni-Cd battery, while our ULTRAMAX line offers up to 70% more capacity.

And, with this power increase comes unequaled design flexibility, such as longer run time, additional features, or downsizing without having to sacrifice performance. Contact your nearest sales engineer by calling 1-800-67-POWER.

And see why no battery ranks higher.
colors on a standard 640 × 480 VGA monitor. An antialiasing feature reduces stair-stepping and provides users with straight lines, smooth circles and arcs, and near photorealistic images. The board is IBM PC/AT-compatible; with its' PC/XT form-factor, it can be used in any size PC enclosure in 16-bit expansion bus slots for applications operating at speeds ranging to 12.5 MHz. The unit has a 60-Hz refresh rate and includes 512k bytes of video RAM on board. The board comes with an Ultra VGA driver for Autodesk applications that use the ADI 4.0 display list driver, such as AutoCAD, Autoshade, and Autosketch. There's also an Ultra VGA driver for Microsoft Windows 3.0. $395.

Monolithic Systems Corp, 7050 S Tucson Way, Englewood, CA 80112. Phone (303) 790-7400. FAX (4303) 790-7118. Circle No. 366

Tape Drive
- Provides 2G-byte storage
- Supports all SCSI commands

The Model 7200 digital audio-tape drive is a 3½-in. form factor unit which provides 2G bytes of data storage on a single cassette without using data compression. Using a 2:1 data-compression ratio, the unit has a 4G byte storage capacity. Fully DDS compatible, the unit supports all standard SCSI commands and features a fast search mode that locates files within 20 sec. The drive includes a head cleaner that automatically activates a loaded cassette. The drive design allows users to employ the company's EEPROM technology to custom-configure the device even after it has been installed in a system. Updates can be sent to the drive from the system via a SCSI bus, or they can be loaded directly into the drive from a digital audio-tape cassette. $1200 (OEM qty).

Wangtek Inc, 41 Moreland Rd, Simi Valley, CA 93065. Phone (805) 583-5255. FAX (805) 583-8249. Circle No. 367

PC/AT Extender Card
- Provides protective buffering
- Controlled by users' test program

The IBM PC/AT-EXT AT-compatible extender card provides a buffer for the computer circuits and other
cards. It allows the card under test to be removed or inserted without powering down the PC or affecting the PC's operation. Card control takes place either manually with on-card switches or by instructions from the users' test program. You insert the card to be tested in the connector on top of the extender and run your test program or turn the extender card's power. In either case, the card will sequence power and ground signals on and off in a nondisruptive manner. A 2-color LED indicates when power is applied to the card under test. Any current overload or voltage short circuit shuts off power to the card. The card works in all IBM PC/ATs and compatible computers. $495.

ICS Electronics Corp, 744S Hillview Dr, Milpitas, CA 95035. Phone (408) 263-5500. FAX (408) 263-5896. Circle No. 368

Interface Board
- Provides intelligent SCSI and Ethernet interfaces
- Works in 3U and 6U VMEbus systems

The MZ 8554 multifunction peripheral board that provides intelligent Ethernet and SCSI interfaces. A single-height (3U) design, the board is designed to work in both 3U and 6U VMEbus systems. The unit is supported by Unix and other leading operating systems. The unit provides a SCSI interface based on the NCR 53C700 SCSI I/O processor and an Ethernet interface based on the Intel 82596 Ethernet coprocessor. Both of the interfaces provide direct memory access to 128k bytes of onboard buffer memory. Both interfaces can execute command sequences independent of the host processor. Software included with the boards provides support for Unix system V release 4 and real-time operating systems such as Microware's OS-9. $995.

Now, Testing 68000/386SX Microprocessors Is A Snap.

Nothing's faster than the chips being developed today, and nothing's slower than hand wiring or trying to analyze these high-density, surface mounted quad flat pack (QFP) devices for test. No worry, Pomona has the answer.

You can choose Pomona's 5711 SMT Test Clip to grab onto all 132 pins of a Motorola 68020 or 68030, or the 5713, to simultaneously access all 100 pins of an Intel 80386SX. Immediately, your interface with logic analyzers, on-line circuit test systems, or lab instruments will be faster, easier, and reliable. A locking mechanism firmly holds the glass-filled, Nylon insulated clip onto the device, making positive contact with each of the IC's gull-wing leads via specially configured, gold-plated, beryllium copper pins. Above, multi-rows of gold-plated phosphor-bronze pins provide an easy-to-access pattern. Suddenly, interface problems are solved.

If you anticipate testing various pin-count PLCC or SOIC devices, Pomona's Test Clip Kits will make testing faster too. And, to make the interface between your test clip and logic analyzer sockets or emulator pods easier, Pomona's Flying Leads are available in low-cost packs, or supplied with the 5711 and 5713 Test Clips as kits. Of course, all of Pomona's other SMT test accessories are ready to make your IC testing faster and less expensive.

Test Adapter
- Tests plastic-leaded-chip-carrier components
- Provides numbered test points

The ANC-4068 provides designers with a method to test and monitor socketed plastic-leaded-chip-carrier (PLCC) components. Numbered test points are provided for scope and meter lead attachment. Modular in construction, the test adapter is easily reconfigured to accommodate PGA (pin-grid-array) or LCC devices by plugging in optional component socket cards. You can also stack the component cards to debug and test multiple levels of PLDs. The base-unit ANC-4068 provides two PLCC stacking levels, and it can be installed in either PGA or PLCC sockets with the mating plugs included. The adapter is also available in 52- and 84-pin versions. $154; optional adapters, $49.

Antona Corp, 1643 1/2 Westwood Blvd, West Los Angeles, CA 90024. Phone (213) 473-8995. FAX (213) 473-7112. Circle No. 370

Diode Arrays
- Are surface mountable
- Feature four diodes in a single package

Available in unidirectional and bidirectional versions, SMDA Series diode arrays are housed in 8-pin surface-mountable TO-8 packages.

Based on Transzorb technology, each unit consists of four independent diodes. Each device protects against power peaks ranging to 300W, has a 5A forward-surge rating, and operates over a range of -55 to +150°C. You can use the board-mountable units to protect all I/O ports and power bus lines. The devices are available for data lines and bus lines rated at 5, 12, 15, and 24V. Housed in molded-unit packages, the diode arrays feature a gull-wing-lead configuration. The low-profile packages are designed to minimize inductance. Unidirectional models, $2.95; bidirectional models, $3.05 (1000).

Miniature Pressure Sensors
- Provide wet-wet sensing for added versatility
- Have 1- to 30-psi range

Series 24PC pressure sensors provide wet-wet sensing capability.
COMPONENTS & POWER SUPPLIES

The line includes units that offer from 0 to 1 psi to 0 to 30 psi. A sensing element features a silicon diaphragm that is integral to an IC chip; four ion-implanted piezoresistors positioned symmetrically over the diaphragm serve as a balanced bridge. The devices' conductive-seal interconnect system cuts assembly time and saves overall production costs by eliminating wire-and tab-bonding connections. The conductive seal also improves reliability. Operating range spans -40 to +85°C. $15.

Compact SCSI / Enet

Mizar's new MZ 8554 packs maximum I/O into minimum VME space.

The newest addition to Mizar's expanding line of 3U VMEbus boards is the perfect solution for your system I/O needs. The MZ 8554 provides intelligent, high speed SCSI and Ethernet interfaces based upon the latest IC technology. Designed for superior system performance, both interfaces provide direct memory access to on-board memory. In addition, both interfaces can execute command sequences independently of host processor intervention, freeing your main CPU from time consuming low-level protocol handling.

The economical alternative to expensive two board solutions, the MZ 8554 meets high-performance I/O requirements for both single-height and double-height VME systems. And, the MZ 8554's price can't be beaten!

Support for the MZ 8554 includes drivers for both Microware's OS-9™ and Wind River Systems' VxWorks™ Real-Time Operating System.

The MZ 8554 is the perfect complement to Mizar's extensive line of 3U CPU's and other peripheral boards. To find out why more and more engineers are turning to VME boards from Mizar, call today.

Mizar. The shortest distance between concept and reality.

Fiber-Optic Connector

- Has crimp termination
- Has 1-dB insertion loss

The Lighterimp ST-Style fiber-optic connector can be terminated to optical fibers using a straightforward crimping technology — no epoxy, oven, or ultraviolet curing is required. A key feature of the unit is an innovative fiber-retention system. This system, combined with simple hand tools, allows a fiber to be terminated within 2 minutes. The 2.5-mm bayonet connector has a 1-dB max insertion loss and a lifetime specification of 500 cycles. Operating range spans -20 to +60°C. $6 to $7.

Snap-Lock ZIF Cable Connectors

- Provide ZIF connection
- Are surface mountable

Type FPZ miniature flex/flat cable connectors feature a hinged snap-lock cover that provides a zero-
"WE'VE HAD GREAT SUCCESS WITH CARROLL TOUCH. WHY CHANGE IF IT'S WORKING?"

John Santacroce  
Mechanical Engineering  
& Project Manager  
Hewlett-Packard Company

"As a diverse international corporation, Hewlett-Packard manufactures everything from computers, measurement and computation equipment, medical equipment, analytical equipment and more. We're known for our high level of test and measurement systems capabilities.

"We recently developed a touch-based automotive test system for a customer and there was no debate over using Carroll Touch in designing this. Our past experience with them has been very successful.

"From my point of view, Carroll Touch has provided good, reliable touch frame assemblies. They also bring a high level of engineering expertise to our team, especially in the materials selection area.

"Carroll Touch people really approach our projects as a team project."

"Working with Carroll Touch people is great because everybody is part of the team – which helps us create a very successful product. Their willingness to go that extra step makes our job much easier.

"In developing a recent functional spec for a touch frame, Carroll Touch engineers worked closely with us in making sure that the assemblies would survive electrostatic discharge.

"We held design reviews of the various approaches and all of our recommendations were considered very sincerely by Carroll Touch. Comments were intelligently relayed back to us and everything we asked for was delivered in the specified time."

---

For more information on how Carroll Touch can help you create success with your touch technology applications, call 512/244-3500, or simply mail your business card with this coupon to Carroll Touch, P.O. Box 1309, Round Rock, Texas 78680.

insertion-force connection. The surface-mountable units have a 1-mm pitch and a closed height of 2.9 mm. The right-angle connectors accommodate from 7 to 25 circuits and are available on embossed tape for compatibility with auto-insertion equipment. Connector contacts are phosphor bronze with a tin plating. The contacts are rated for 0.5A at 50V ac or dc. The glass-filled PBT housings have a UL 94V-0 rating.

Field-Effect Transistor
- Operates to 13 GHz
- Has 9.5-dB gain

The NE42184A FET is designed to serve as a low-noise or gain-stage device for 0.5- to 13-GHz industrial, commercial, or consumer applications. Key performance characteristics include a typical noise figure of 1.2 dB at 12 GHz and a typical gain figure of 9.5 dB at 12 GHz. The FET design features mushroom-shaped gates to help decrease gate resistance and improve power handling. The device comes in an epoxy-sealed, metal-ceramic package. It’s available in quantity on a tape-and-reel cartridge. $6.85 (1000).

Digital Attenuator
- Operates to 4 GHz
- Has 32-dB max attenuation

The Model DAS-124 attenuator operates over a frequency range of 1 to 4 GHz and can switch as many as 4 bits. Bit attenuation figures
WHEN WE DESIGNED OUR NEW NFC SERIES DC/DC CONVERTERS, WE INCLUDED EVERYTHING. EXCEPT COMPROMISE.

Designed to fulfill the needs of the nineties, our new NFC family of power converters are more compact, consistent and cost effective than competitive products.

For example, the NFC40 packs over 16 watts per cubic inch — 5 times more than similar converters. Plus up to three outputs with various user interface functions. The cooling baseplate makes heatsinking easy. And its small footprint and low profile are ideal for space critical applications in telecom and data communications.

But more power and features per inch weren't the only goals we set for ourselves. We built in more reliability too. Most models are built on a rugged thick film hybrid substrate in an automated assembly process so highly controlled and repeatable, you get consistent quality and reliability whether you order ten or ten thousand. And lower costs too!

The NFC family's high efficiency allows them to withstand hot ambient temperatures. Their wide input voltage range lets you operate from a poorly regulated 24V or 48V power source, or even from a battery as it discharges.

Best of all, the NFC series is a winner in value too. Because in addition to more power density and reliability, we also included many useful features. Like a choice of single or multiple user-adjustable outputs. Or converter inhibiting with a simple TTL signal.

For real value, don't settle for anything less than the best. Ask for Computer Products NFC Series. Because we didn't compromise — and neither should you. For the name of your local distributor, call 1-800-624-8999, extension 123.

THE NFC FAMILY OF DC/DC CONVERTERS

EDN June 20, 1991 CIRCLE NO. 211
range from 0.5 dB min to 32 dB max. The unit uses advanced CMOS-TTL-compatible drivers that provide switching speeds of 100 nsec max. The miniature all-ceramic (including lid cover) surface-mount package is microstrip compatible and features solderable or wire-bondable transmission line and logic input connections. Additional attenuator models provide a 6-bit switching capability but have a reduced operating frequency range. 4-bit model, $400.

Bilevel LED Arrays
- Available with red, yellow, and green LEDs
- Available in a number of versions

Available with red, yellow, or green LEDs, Series 552 and 553 bilevel arrays are designed for high-density pc-board applications. The 552 models feature T-1½-sized LEDs, and the 553 models offer T-1-sized LEDs. The 552 Series units are available in standard-efficiency, high-efficiency, super-bright, and super-efficiency versions. A bicolor (red/green) LED and units with integral resistors are also available in the series. The 553 Series includes three versions—standard efficiency without resistor, a super-efficient unit for 2-mA operation, and a 5V unit, which includes a built-in resistor. Operating range spans -20 to +100°C and -55 to +100°C for 552 and 553 Series devices, respectively. Series 552, from $1.11; Series 553, from $1.16 (1000). Delivery, stock to eight weeks ARO.

Surface-Mount JFET
- Provides RFI immunity
- Operates in the 900-MHz range

Housed in a surface-mountable SOT-143 package, the BFR200 Channel JFET is designed to suppress RFI in sensitive detection equipment. By integrating two resistors and two MOS capacitors onto a single silicon chip, the unit adds a lowpass filter to the input stages of this sensitive equipment and suppresses RFI signals in the 450- to 900-MHz cellular radio range. The JFET eliminates the need for additional passive components. The device is designed primarily to prevent the generation of false events in IR detectors, burglar alarms, electret microphones,

THE NEW MICRO-CAP III™
SO YOU CAN TEST-FLY EVEN MORE MODELS.

It wasn't easy. But we did it. Made the long-time best-selling IBM® PC-based interactive CAE tool even better.

Take modeling power. We've significantly expanded math expression capabilities to permit comprehensive analog behavioral modeling. And, beyond Gummel Poon BJT and Level 3 MOS, you're now ready for nonlinear magnetics modeling. Even MESFET modeling.

Analysis and simulation is faster, too. Because the program's now in “C” and assembly language. That also means more capacity — for simulating even larger circuits.

As always, count on fast circuit creation, thanks to window-based operation and a schematic editor. Rapid, right-from-schematics analysis — AC, DC, fourier and transient — via SPICE-like routines. The ability to combine digital/analog circuit simulations using integrated switch models and parameterized macros. And stepped component values that streamline multiple-plot generation.

And don't forget MICRO-CAP III's extended routine list — from impedance, Nyquist diagrams and BH plots to Monte Carlo for statistical analysis of production yield. The algebraic formula parsers for plotting virtually any function. The support for Hercules, CGA, MCGA, EGA and VGA displays. Output for plotters and laser printers.

Cost? Still only $1495. Evaluation versions still only $150. Brochure and demo disk still free for the asking. Call or write for yours today. And see how easily you can get ideas up and flying.

**Bypass Boards**  
- Provide simple jumpering  
- Maintain system airflow  
These bypass boards provide a simple solution to the problem of filling empty or spare slots in a VXIbus system. The units electrically pass through the Busgrant and IACK daisy-chained signals to other boards in the system. Air baffles provided on the board surface maintain the integrity of the air-flow system. On each model, a front panel, complete with ejectors, is attached to an aluminum substrate that doubles as an RFI barrier. A specially configured male DIN connector provides the bypass path for the signals. The boards are available in A, B, C, and D sizes as specified in the VXIbus standard. C-size board, $44.63 (100).

**Dawn VME Products**, 47073 Warm Springs Blvd, Fremont, CA 94539. Phone (415) 657-4444. FAX (415) 657-3274.  

**1500W Power Supply**  
- Has 0.99 power factor  
- Meets IEC-555-2 specification  
The SPF4 supply provides as much as 1500W of power and features a 0.99 power factor. It meets all international safety and EMI requirements including the IEC-555-2 specification for input-current harmonic content. The supply also features a universal 85 to 264V ac input, and it can be configured to provide as many as 12 outputs. A selection of 38 fully regulated single- and multiple-output modules is available in voltages of 2 to 48V and power ratings of 240 to 1250W. Parallel operation with true current sharing is standard on all single-output modules. A steel 5 x 8 x 11-in. package, which is by a ball-bearing fan, fully encloses the power supply. $1091 (OEM qty).  

**The Ultimate VMEbus Tool Set**  
Based on the VBT-321 Advanced VMEbus Analyzer, VMETRO's Modular VMEbus Analyzer System offers piggyback modules for all kinds of VMEbus development, verification and tuning purposes.

VMETRO's Modular VMEbus Analyzer System gives you unrivalled measurement capability in a single VMEbus slot. Pick the right piggyback module to the VBT-321 VMEbus Analyzer and obtain:

- **VMEbus Anomaly Trigger**  
- **VSB State Analysis**  
- **P2 General Purpose Analysis**  
- **VME Cycle Generator**  
- **256K Trace w/SCSI dump**

VMEbus Anomaly Trigger reveals incompatibilities and spec. violations. Combined VMEbus State trace and 100MHz Timing Waveform. Real-time VMEbus histograms shows bus usage, event counts, etc.

The Magic Module™—DC/DC Converter... the ultimate in proven performance, power capability, size and features...

When designing a DC/DC converter into your system, you want the assurance that a surprise is not going to pop up. With Electronic Measurements’ EMQ Series of Magic Modules, you have the assurance of dependable performance, since the design incorporates proven fixed frequency, forward converter technology with current mode control and a nominal frequency of 250 kHz. Another good reason to choose the Magic Module is size. The EMQ Series also offers the highest power rating for any self-contained 5-V output, high density, board mounted unit available.

For example, the EMQ48-05-40, rated at 200 W, occupies a footprint of only 2.4" x 4.6" with a 0.625" profile, and a nominal input of 48 VDC.

For a pleasant surprise, check these MAGIC MODULE features:
- More watts per cubic inch than any other 40 Amp. converter
- Forward converter topology for proven reliability
- Fixed frequency (250 kHz) for EMI reduction and stability
- Soft start
- RMS current reduced to negligible levels in a short circuit mode
- Unit latches off in an overvoltage or over temperature condition
- Operates in the N+1 Mode for system redundancy
- Standard units include outputs from 5 to 48 VDC, inputs from 10 to 300 VDC, 50 to 200 watts power out
- Thermal characteristics allow for PC board mount with only natural convection up to 50 watts

Best of all, you have the assurance that THE MAGIC MODULE comes from Electronic Measurements, a company with over 40 years of power conversion experience.

THE MAGIC MODULE brochure is yours for the asking. If you need information immediately, call TOLL FREE 1-800-631-4298 (In NJ, HI, AL and Canada 908-922-9300).

EDN June 20, 1991
Now you don't have to compromise the performance of your 16 MHz and 20 MHz systems. Now you can create true zero wait-state 16 MHz and 20 MHz systems. Not close to zero; but true zero wait-state designs. Eliminate "patchwork" solutions requiring complex, expensive interleaving, page mode designs, or costly cache schemes.

Upgrade your systems to direct memory access — and get the benefits of higher performance and lower cost. The perfect mid-life "kicker" for your current designs; stake out a strong competitive position for new designs.

See for yourself ... We'll send you Free samples (up to 1MB) to evaluate in your designs. Just fax us your rough block diagrams for review — we'll be in touch ASAP! Only one qualification: It must be a company funded/scheduled project.

Don't put it off. Your free samples are available now from NMB — the high-speed DRAM specialists. Fax us your design sketches today. Or give us a call at (800) 662-8321 for further information.
PLD OPEN SYSTEMS
THE BEST WAY

This is a testimonial for open design systems for programmable logic. Atmel thinks it’s the best way for you to go.

You have enough problems, and your hands should not be tied with proprietary design systems. You should be able to pick the latest and greatest third-party tools for programmable logic. Standard tools will cut system entry costs (the boss will love that), and you won’t have to upgrade the kit for each new device architecture. And, you’ll be able to use anyone’s PLDs (especially ours).

Atmel features an architecture that gives high-gate utilization and predictable high-speed performance. And, here’s a bonus: your application will not affect the performance of our EPLDs.

So, if you want programmable logic that meets the spec no matter what your application, call Atmel, the people who think that open design systems are the only way to go.

DECLARE YOUR INDEPENDENCE!
Development Puzzles
Solved by Pentica
(Part One of a Design Dictionary)

Trace Buffer n. Digital memory part of in-circuit emulator. Used to store a sequence of microprocessor addresses, data and status for post execution analysis.

The Puzzle: You have developed a complex real time system with interrupt driven multi-tasking software. Each of the software tasks has been debugged. No problems show up under simulation. The hardware designer, insisting his part works great, has gone on vacation. However, the complete system crashes after anything between 10 minutes and 3 hours.

The Solution: Use an ICE with a trace buffer large enough to capture the events which lead to the crash. Complex and sequential triggering of the trace may be required to stop tracing events which occur after the crash--an 8k word trace buffer could overflow in under 2ms. Pre-filtering of trace cycles can be used to extend the capture time. The ability to re-trigger the trace allows critical areas to be traced and then disregarded if the crash does not happen. Comprehensive search facilities are needed to analyse large amounts of data.

Pentica's MIME-700 in-circuit emulator offers these features and more, while Pentica prides itself on its superior technical service and support. Write or phone and let's start solving your next development puzzle!
A core, two caps and nickel chromium film can’t get you to market sooner.

Dale® Can.

Metal film resistance. Lots of people supply it, but at Dale® we have more ways to make it work to your advantage.

From the start, we'll give you more alternatives for fine-tuning resistance to your application — right out of the catalog. Low cost commercial to ultra precision.

High power, Ultra high or low value. Tight tolerance. Matched sets. Thick film chips, plus thin film chips for surface mounting.

Qualifications include: MIL-R-10509, MIL-R-22684, MIL-R-39017, MIL-R-55182 and MIL-R-55342.

NEW PRODUCTS

TEST & MEASUREMENT INSTRUMENTS

Magnetics Tester

- Measures turns and turns ratio
- Checks for open and shorted coils and improper air gaps

The 2000 Coil Test and Magnetics Design system is a benchtop instrument that, among other things, measures transformer turns ratios and numbers of turns in coil and transformer windings. It also checks for open coils, shorted turns, and improper air gaps. Measured values appear on a large LCD. The unit measures turns ratios with ±0.1% accuracy. The system's general-purpose application block is suited to testing a variety of magnetic devices. Custom application blocks offer further flexibility. $3350.

Influx Corp, 106 Billings St, Sharon, MA 02067. Phone (617) 784-5606. Circle No. 381

SCSI Bus Emulator

- Runs on IBM PC/ATs and compatible computers
- Emulates host CPU or peripheral devices

Emulating either a host CPU or a peripheral device, the PED-4500 SCSI bus emulator lets you debug SCSI systems operating asynchronously to 5M bytes/sec or synchronously to 6.25M bytes/sec. The emulator supports the SCSI II standard in the host and target modes. A target-description library contains information on target devices.

You can create custom libraries that include unique commands, messages, and data structures. Debugging occurs either interactively or under program control. $1295 to $1995.

Pacific Electro Data, 14 Hughes, Suite B205, Irvine, CA 92718. Phone (800) 676-2468; in CA, (714) 770-3244. FAX (714) 770-7281. Circle No. 382

SCSI Disk-Drive Tester

- Evaluates single-ended drives per ANSI SCSI-1 and -2
- Sends results either to printer or 3½-in. disk

The portable PR4050 SCSI disk-drive tester evaluates single-ended hard disks that conform to the ANSI SCSI-1 and -2 definitions. The tester sends results to a printer via a parallel port or can store them on an IBM PC-compatible 3½-in. floppy disk. The unit incorporates an editor with which you can create command-descriptor blocks and custom test routines. The command blocks and routines reside in 64k bytes of nonvolatile RAM; you can also transfer them to a floppy disk.

Influx Corp, 106 Billings St, Sharon, MA 02067. Phone (617) 784-5606. Circle No. 381

The unit, which includes an RS-232C interface, can supply power to the drive under test. $12,850.

Pioneer Research, 106 Billings St, Santa Monica, CA 90404. Phone (800) 223-1745; in CA, (800) 848-1745. FAX (213) 453-3929. Circle No. 383

SCSI Bus Analyzer/Emulator

- Supports SCSI-1 and -2
- Traces bus activity to 10 MHz

The 202/F SCSI bus analyzer/emulator supports the SCSI-1 and -2 standards. It can trace bus activity at speeds to 10 MHz. The unit, which works with an external terminal or PC, provides a 128k-frame trace memory with 40-nsec time-
New Pulse Magnetics For Worldwide Telecom Applications

- Superior pulse transformer technology applied to advanced telecom magnetics.
- Full compliance with national and international standards for worldwide use.
- Excellent performance proven by leading IC transceiver manufacturers.

ISDN S-Interface transformers comply with CCITT I.430. UL recognized. BABT approved. Single or dual packages.

T1/CEPT PCM-30 transformers. Over 30 models, including dual packages. Comply with CCITT G.703.

Common Mode Filter Chokes, to reduce high frequency noise for compliance with FCC, CISPR, VDE limits on radiated EMI.

Handheld LCR Meter

- Resolves 2000 counts
- Measures 20,000 µF, 200H, and 20 MΩ

The 470D handheld, battery-powered, 3½-digit meter measures inductance, capacitance, and resistance. It provides seven L ranges from 200 µH to 200H; nine C ranges from 200 pF to 20,000 µF, and eight R ranges from 2Ω to 20 MΩ. The unit also measures the dissipation factor (D) of capacitors. It tests at 120 Hz and 1 kHz. The vendor supplies probes for surface-mountable components. $249.

PROTÉUS

...CAUSING A SEA CHANGE IN AFFORDABLE INSTRUMENTATION

As the Greek God Protéus could assume many forms, so can our Protéus. With various software modules and corresponding adapters, Protéus can transform itself into a Universal Device Programmer, Data Logger, Universal Controller, Programmable Power Supply, Universal Device Tester and PCB Tester.

The New Wave in Instrumentation Begins with Bold Features:

- Standard IBM-PC parallel printer port;
  Optional detachable IBM-PC compatible computer for stand-alone operation;
  Built-in Power Supply.

- Flexible yet powerful Algorithm Development System supporting Symbolic Pinout Mapping allows customization of all applications according to specific needs. Add new programming algorithms, implement On-Board Programming, create custom test programs.

- Up to 296 overcurrent protected mixed analog & digital pins/channels;
  Voltage Source & Sink,

- Universal Programmer supports virtually all devices on the market and features:
  True Self Calibration/
  Diagnostics, Programmable Current Generator, Part
  Insertion Sensing, Continuity Test, True State Machine
  Testing, Handler Interface;
  Adapters for Gang, PLCC, etc...

from $995

[Basic Unit with Programming Adapter supporting up to 40 pin devices;
Detachable computer shown in photo not included.]

800M-Sample/Sec Logic Oscilloscope

- Resolves repetitive events to 50 psec
- Uses same probes for logic analysis and waveform viewing

The 16482 high-speed probe works with the vendor’s Model 1600 logic oscilloscope. The instrument, a logic timing analyzer expandable to 160 channels, displays analog waveforms instead of the usual binary data. The probe, a small box with two probe tips, connects to one of the scope’s 8-channel input groups. The probe samples single-shot data on two channels at 800M samples/sec or on four channels at 400M samples/sec. You can use more probes to capture additional high-speed signals. With repetitive signals, the scope’s effective timing resolution becomes 50 psec and its vertical resolution also improves. Bandwidth for all signals is 350 MHz. $750. Delivery, 45 days ARO.

Outlook Technology Inc, 200 E Hacienda Ave, Campbell, CA 95008. Phone (408) 374-2990. TLX 350479. Circle No. 387

Analog Signal Conditioners

- Offer 1500V continuous common-mode isolation
- Inputs withstand 240V ac

The PCI-5B line of analog signal-conditioning modules conforms to a de facto industry standard. The family consists of 29 products. The conditioners, which are encapsulated in hard epoxy, are physically interchangeable with one another and plug into panels that accommodate multiple units. The modules accept inputs from such sources as 4- to 20-mA current loops, resistance-temperature detectors, and thermocouples. The thermocouple conditioners provide linearization and cold-junction compensation. In-
put-to-output ohmic isolation withstands 1500V continuously. Inputs withstand 240V ac. From $150.

Capacitance Meter
- Measures at 1 MHz
- Provides ±100V programmable bias

The Model 7200 capacitance meter measures capacitance at 1 MHz in the presence of parallel loss. The instrument computes and displays parallel resistance, dissipation, quality factor (Q), equivalent series resistance, and equivalent series capacitance, as well as the difference (in percentage or pF) of a measured capacitance from a preselected value. The unit measures capacitance from 0 to 2000 pF and conductance from 0 to 2000 µS. You can program the test levels from 15 to 100 mV. An optional internal supply produces bias voltages in the ±100V range. The unit, which you can control via the IEEE-488 bus, will display these voltages or external bias levels in the ±200V range. $4795. Delivery, four to six weeks ARO.

Remote Diagnostic Software
- Uses digital scopes and phone lines
- Runs on an IBM PC at central repair depot

PM 9372 Telegnostics software permits remote troubleshooting and fault diagnosis on complex electronic equipment. The software uses a digital storage oscilloscope (DSO) at a remote site linked by telephone lines to an IBM PC at a central repair depot. The software sends setups and reference waveforms to the remote scope and downloads captured waveforms for display on a second DSO—this one at the repair depot. Messages can be transmitted to a technician at the remote site and displayed on the screen of his DSO. The software supports the vendors' DSOs that have RS-232C ports. $200.

CUSTOM DESIGN

Futaba is the leading global supplier of vacuum fluorescent displays and modules. We have the capability, technology, and market knowledge to provide you with the most cost effective display system tailored to your specific application.

Futaba's high brightness fluorescent display products range from simple numeric and dot matrix displays to large multi-color graphic panels.

TECHNICAL SUPPORT

Futaba engineers have a broad range of application experience including automotive, point of sale, appliance, medical, and instrumentation products. They are ready to assist you in optimizing your display system design.

U.S. MANUFACTURING

Futaba's state-of-the-art SMD manufacturing facility in Schaumburg, Illinois provides local service, JIT delivery, and reinforces its commitment to supply the North American market.

QUALITY

Futaba's number one commitment is supplying products having the highest level of quality. Quality begins with the initial design and is controlled throughout the manufacturing process by using SPC and having well trained and motivated employees.

Futaba is dedicated to the principal of continuous improvement and always strives to provide the highest level of customer satisfaction.

Pick up the phone - take advantage of our superior technical background and design expertise. Call or write for more information on Futaba custom vacuum fluorescent display modules.
Right Angle Pressfit
Cost-efficient ERNI pressfit connectors for the Eurocard sub-assembly:
• Type B & C male versions and Type Q & R female versions
• Universal press-in technique for thru hole or SMT board designs
• Gas tight connection withstands corrosion and vibration

LDG
Miniature Housing Enclosures
Multi-use, non-metallic, miniature, housing enclosures:
• Internal PCB mount terminal blocks
• Multiple connecting options (from 12 up to 70)
• DIN-rail mountable

Extended DIN High I/O Connectors
Extended DIN connectors including 120, 128, and 150 positions:
• Cost-efficient inverse (reverse) style two-piece DIN connectors
• 3 row (120 & 150) or 4 row (128) versions
• Solder, wirewrap, & pressfit options

PCB Edgecard Connectors
ERNI Edgecard connectors featuring the latest configurations and options:
• Connectors for every bus type like STD, Multi (+ S-100), Q, Apple II, XT & AT, Microchannel, and more
• Complete range of high-density .050" types
• Extensive options in contact style, type of termination, mounting, and plating

.050" SMC
Introducing ERNI's .050" SMC two-piece high-density connector system:
• Perpendicular (daughter to mother board), stacking (parallel or mezzanine), and side-to-side (edge-to-edge) mating configurations
• Anti-twist contact design assures longer life and reliability
• Built-in keying plug cavity for easy plug installation

Application Specific DIN Connectors
PCB process compatibility and application specific options from ERNI:
• SMT DIN Connectors
• PCB hold-down clips
• Variable pin lengths for early-make late-break connections for "Zap-proofing"

CIRCLE NO. 154

IN THE SPACE OF THIS 7"x10" AD YOU COULD MAKE 4,640 CONNECTIONS.

Introducing The New High-Density 160 Connector From ERNI.
An interesting addition to DIN 41612, the new Type E and TE 160 pin connectors meet today's design needs for high-density connectors. So pack it in: 160 connections in an array of 5 rows of 32 contacts in 3.740" x .618" — Type E 160 external dimensions (Yes, 29 connectors could physically fit in this ad space)

Spec it where miniaturization requires more contacts in less space. Take advantage of its flexibility through either standard (E) or inverse (TE) styles. Choose your connections: dip solder, wire wrap, or compliant pressfit. More choices: 3 quality grades with either gold- or tin-plated termination areas — providing design options to withstand up to 500 mating cycles. Add in ERNI's Eurocard Center connector and you have a multifunctional signal + coax + power + fiber optic system or 362 signal connections all possible on a double Eurocard. The selection list seems endless when you include backplane shrouds, coding strips, pressfit tooling, and more.

And with ERNI you get a world-class supplier manufacturing in 5 countries with offices in 20 others. With ERNI you get more than just a DIN supplier, you get a multi-product company.

In order to truly understand what ERNI connectors mean today and how they have a future, we recommend a phone or write to: ERNI Components

First, All Of Your DC Power Source Needs In One Small Package...

...And Now All Of Your DC Loads, Too!

Introducing Programmable DC Loads
The new AT8000A Programmable Loads are based on the new "instrument on a card" technology that became so popular with our AT8000 Power Sources. The AT8000A can house up to six 300W loads in one 5 1/4 inch drawer. By paralleling modules, you can increase the load of any single channel up to 1800W. And by adding expansion chassis, you can increase the system up to 16 channels!

Now You Can Meet Virtually Any ATE DC Source or Load Requirement
You'll appreciate the fact that the Elgar DC Loads and Power Sources can be used in any combination in the same AT8000A chassis. Plus, the option of Built-In Test (BIT) allows you to perform self testing and measurement of system parameters through the bus. The AT8000A can also include an embedded TMA and accept CISL commands per MATE Interface Standard 28067633.

Elgar Power Is Preferred the World Over.
For over 25 years, Elgar has been the standard in AC Power Sources with over 50,000 programmable power sources and frequency converters in the world being used in science, industry and defense. With the introduction of the AT8000 DC Power Sources, Elgar applied that standard to DC Power Sources. Now, Elgar continues to advance the standard of excellence that has been applied to DC Power with the introduction of Loads for the AT8000A.

For more information about how the AT8000A Power Sources and Loads can help you solve your ATE testing needs, call:

How Design Work Becomes Teamwork.

The DAZIX Simultaneous Engineering Environment (SEE) turns design work into teamwork. SEE allows your departments to coordinate efforts during every phase of the design process. This helps to improve product quality, lower production costs, and get products to market faster.

SEE delivers the integration you asked for. Common database management. Common user interface across applications. And a complete toolset, including solutions for front-to-back electronics design, mechanical design, manufacturing, and document management.

What’s more, with SEE, your entire team can benefit from an open-system framework. A framework that integrates DAZIX, Intergraph, and Sun products — as well as leading third-party tools — in a single environment.

There’s more you should know. Call us today at 800-239-4111 for a free copy of Simultaneous Engineering. In Europe, call 33-1-4537-7100. In the Asia-Pacific area, call 852-8661966.

DAZIX
An Intergraph Company
Self- and Mutual-Inductance Simulator
- Calculates inductance in nonmagnetic media
- Handles IC package leads, bond-wires, and all coil types

Henry is a 3-D inductance simulator that calculates self and mutual inductance of complex structures in nonmagnetic media. The program uses the complete mathematical definitions of inductance and mutual inductance, which are based on the energy stored or shared between magnetic circuits. Use of these definitions removes any limitations imposed by nonmagnetic media. Typical applications are for the calculation of inductances in IC package leads, ground planes, vias, traces, and any kind of coils. The simulator does not require a ground-plane structure in order to calculate the solution. The program runs on Sun-3, Sun-4, and Sun SPARCstation computers under SunOS, or on Mips workstations under Unix. From $40,000.

C Functions For Geometric Computations And Display
- Geometric computations include NURBs
- Compatible with AutoCAD Development System Release 10

CAD/CAM Developer's Kit/2D is a library of C functions for geometric computations, display, and DXF data exchange. Geometric computation functions include construction, rotation, scaling, mirroring, intersection and trimming of lines, and NURBs (Non-Uniform Rational B-Splines). The display functions allow you to set up one or more viewports and to pan or zoom; these functions are adaptable to popular graphics libraries. The DXF data-exchange functions allow you to read and write ASCII and binary files, and are compatible with all AutoCAD release 10 entity-types. The CAD/CAM Developer's Kit/2D is a subset of the vendor's full 3-D Developer's Kit, and you can upgrade to the 3-D version at any time. The personal edition, for in-house use only, $399; upgrade to 3-D edition, $600, professional edition upgrade, which provides royalty-free distribution rights, $500.

Building Block Software Inc, Box 1373, Somerville, MA 02144. Phone (617) 628-5217.

Simulation Model Bank
- Includes both architectural and structural models
- Compatible with Zycad's hardware simulation accelerator

The Model Bank service is founded on joint agreements with leading manufacturers to market both architectural and structural simulation models of microprocessors and logic modules. The structural models are based on existing hardware and allow users to construct simulation models of complete systems and subsystems for use in prefabrication verification. The architectural models, such as those of the Mips R3000, R3010, and R4000 devices, allow you to design systems with processors that are not yet available in silicon. All of the models are compatible with Zycad's hardware simulation accelerator, and yield better accuracy than suboptimum techniques such as behavioral model or in-circuit emulation. Subscription to Model Bank, from $5000.

Protocol, 500 International Dr, Mount Olive, NJ 07828. Phone (201) 347-7900. FAX (201) 347-8525.

**CAE & SOFTWARE**

of active filters that runs on IBM PCs and compatibles. You can design Butterworth, Chebyshev, Bessel, Real-Pole, Gaussian, Linear-Phase, or Elliptic filters. You can define a filter by its polynomial transfer function, by its poles and zeros, or by its gain. Conversely, for a filter that you’ve already designed, based on a specific topology and populated with specified component values, the software will display the ideal characteristics, along with Monte Carlo sweeps of the filter’s performance. You can now output hard copy of Hercules, CGA, and EGA graphics directly to dot-matrix and laser printers. When you’re building a filter with standard-value components that significantly shift the passband/stopband borders away from the design center, a “best combination” feature allows you to change some of these values in such a way as to approach the design center more closely. $745.

Maxtor 7080

Simplicity of design makes Maxtor's Cheyenne Series inch-high 80MB 7080 disk drive the most reliable in its class. Compare Maxtor's four-head, two-platter design to Seagate's six-head, three-platter design. Fewer moving parts make Maxtor's drives inherently more dependable. Power consumption is a very low 2.8 watts, making it one of the lowest in the 80MB class. The 7080 is also Novell Labs certified, and is available with either SCSI or AT interface, giving you flexibility for a winning system. Exceptionally fast 17ms seek time and 32K cache buffer in the new generation inch-high form factor give Maxtor faster data throughput than the competition.

Call and ask about our entire Cheyenne family of disk drives with capacities from 40MB to 130MB. Don’t fall for the off-the-wall claims. Give us a shot and we’ll prove Maxtor specs can’t be matched. Call your nearest Authorized Maxtor Distributor.

Enhanced Autorouter

- New Reconstruct algorithm replaces ripup-and-retry
- Multiple passes handle SMDs and wide traces

Tango-Route Pro is a high-performance autorouter for IBM PCs and compatibles. The vendor has replaced older ripup-and-retry algorithms with a much faster “reconstruct” algorithm. The program performs multiple passes in three phases. The constructive phase includes special passes for SMDs (storage-module drives), wide traces, and memory routing. The remove-and-replace phase may include as many as 10 iterative passes, yielding fewer layers, fewer vias, and shorter traces. The manufacturing-improvement phase may have as many as 10 manufacturing passes and one final manufacturing pass. The program runs under the vendor’s Accel Productivity Interface, a Windows-like, menu-driven interface that helps both the novice and the professional designer. All routing options are selected from menus and dialog boxes; prompts and on-line help provide cues to proper operation at each phase. The program supports both uniform and nonuniform routing grids, allowing virtually any board density and any combination of design rules and pad sizes. Tango-Route Pro interfaces to Tango-PCB and Tango-PCB Plus layout tools. $5500.

**Virtual-Memory Spice**

- **Runs 10,000-transistor circuits**
- **Processor reads Spice output files**

RSpice is a virtual-memory version of Spice release 2g6 for use on 80386- and 80486-based PCs. The program determines the amount of extended memory available; as the program runs, if the simulation requires more memory than is available, the program begins swapping to disk and completes the simulation. With as little as 1M byte of extended memory, the program handles circuits with as many as 10,000 transistors. The RGraph graphical postprocessor can read a standard Spice output file from RSpice or any Spice-like simulator, as well as ASCII data files. This program directs hard copy of an RSpice screen plot to HP laser printers. RSpice and RGraph together, $295; free demo disk available.

When you need surface mount aluminum electrolytic capacitors, remember that all signs point to Nichicon. Because now there are seven surface mount electrolytic series ready to help your products meet their marketing window—on time and on budget.

Save time. Save space. Save money. Who isn't under pressure these days to reduce costs? Well now you can, without sacrificing performance, when you design your new products or replace comparable tantalum capacitors with Nichicon surface mount electrolytics.

More Nichicon advantages. Your real bottom line though is still capacitor performance. And with seven series with 1,000 to 5,000 load life ratings to choose from, your chances of finding your capacitor choice are better than ever.

Each series is carrier-taped and reeled and features Nichicon's anti-solvent design.

For your free Nichicon Capacitor catalog or more information, call your local Nichicon representative or distributor, or call us at (708) 843-7500.

927 E. State Parkway • Schaumburg, IL 60173 • (708) 843-7500

One good idea after another.
Get on board NEC's 3-MIPS V53

On-board peripherals, that is
Our V53 microprocessor has some very important passengers, right on the chip. Like a 71071- and 8237-compatible 4-channel DMA controller that delivers eight megabytes per second data throughput. And three 8254-compatible timer/counters, a 16-bit refresh counter, an 8259-compatible interrupt controller, and 8251-compatible serial I/O port. All on-board, and all software compatible with industry standard devices.

Wicked fast
But if you think the weight of all this on-board cargo slows anything down, think again. Our 16 MHz microprocessor screams along at a minimum instruction execution speed of 125 nanoseconds and can address up to 16 megabytes of memory. And on-board hardware allows memory implementation of a LIM 4.0 specification. Of course, the V53 is instruction-set-compatible with the entire V-series family of microprocessors and can serve as your embedded DOS engine. Don't settle for less than both thrilling speed and on-chip peripherals.

Smooth ride
And since you want a ride that's smooth as well as a fast, we offer you the development tools you need. And whether you choose the 132-pin PGA or 120-pin QFP, you'll save time, money and board space when you specify NEC's V53 16-bit microprocessor, with on-board peripherals.

Free Data Book
For your free copy of NEC's 16-bit V-Series Microprocessor Data Book, call 1-800-632-3531. Ask for Info Pack #100.

ZT 8901 Single Board V55 (80286) Computer
Mil-Spec NDI Computer Sub-Systems to Meet the Standards of the U.S. Army, Navy, Air Force, Marines ...and the U.S. Taxpayer.

The urgent need for reliability in Mil-Spec equipment and systems requires no further justification. If you’re designing or integrating computer systems for any of the Armed Forces, reliability is paramount. And it must be achieved at reasonable cost levels.

At Radstone Technology, we have a proven strategy that enables you to control costs without compromising reliability, quality or performance. Our Mil-Spec computer boards and sub-systems meet the most stringent U.S. and international military requirements and the increasing mandate for NDI (Non-Developmental Item) products. Radstone NDI Mil-Spec VME provides proven economies in terms of hardware, software development and compatibility, plus reduced time to market and performance-proven reliability. That’s why, now more than ever, the DoD, military and prime contractors are counting on Radstone for Mil-Spec NDI VME. Radstone Mil-Spec VME. It’s the right way to cut costs without cutting corners. Let us show you how your programs can take advantage of our technology, using an accepted standard and a winning strategy. We’ll help you meet the requirements of the military and the taxpayer.

MEET
OUR RUGGED TEAM

We've expanded our line of rugged microcomputers into a full team of products, all built rugged from the ground up. These are full rugged systems, versatile enough for military applications, and tough enough for the harshest environments.

- The KMS-4000 - powerhouse 386 or 486 microcomputer. Direct access to four removable media. Larger 10.4" EL display. Low MTTR, dependable KMS rugged technology.
- The CP-1932(3)/UYK - rugged PC/AT-compatible micro, praised for performance and reliability during Desert Storm. '386 or '486 computing power. Internal EL display. Fixed and removable drives. Portable or rack-mount.
- The RCM-1900 - tough 19" color monitor, fits standard rack for rugged graphics anywhere. Brilliant image, resolution to 1,280 x 1,024 pixels.

For more information on the complete KMS team of rugged hardware, call:

1-800-521-1524

Labview 2 Demo, Video, And Directory

Three literature choices are available for Labview 2. The 30-minute demonstration disk shows how to develop virtual instruments for data acquisition and provides instrument control applications. The demo requires a Macintosh with 2M bytes of RAM, 2M bytes of available hard-disk space, and a 13-in. monitor. In the 6-minute video tape, Applications, users of industrial, laboratory, and educational applications describe how they use the Labview 2 graphical programming software. The video comes in VHS or PAL formats. Solutions, a directory of consultant services and products, provides a desktop reference guide to programming or application consultant services in a particular field.

Three Software-Specific Journals

Insidet Turbo +++, a 16-pg monthly journal, offers programmers information about polymorphism, inheritance, debugging object hierarchies, and third-party object class libraries. This periodical demonstrates proven techniques with actual examples and code samples that you can download from the vendor's on-line information system. The DOS Authority provides tips and techniques for consultants, programmers, and MIS managers. Topics include configuring tips and techniques; in-depth explanations of documented—and undocumented—DOS commands; a behind-the-scenes look at DOS internal devices; and debug scripts or GWBasic routines that create tools and utilities for enhancing DOS. The third journal, Inside QuickBasic provides information about using DOS and BIOS calls, optimizing QuickBasic programs for size and speed, creating intuitive user interfaces, and communicating with serial and parallel devices. 1-year subscriptions: Inside Turbo +++, $79; The DOS Authority, $99; Inside QuickBasic, $59.

The Cobb Group, 9420 Bunsen Pkwy, Suite 300, Louisville, KY 40220. Circle No. 402

Paper Compares Throughput Of Counters

The 4-pg paper, Optimizing Throughput with HP VXI, compares the throughput of the HP E1420A VXI universal counter with that of a message-based VXI counter and an HP-IB equivalent of the HP E1420A. A second comparison shows the time savings achieved by using register-based devices. The paper discusses SCPI (Standard Commands for Programmable Instruments), register-based devices, continuous acquisition, and programming of register-based devices and controllers.

ULTRA-MINIATURE SURFACE MOUNT

DC-DC Converter Transformers and Power Inductors

These units have gull wing construction which is compatible with tube fed automatic placement equipment or pick and place manufacturing techniques. Transformers can be used for self-saturating or linear switching applications. The Inductors are ideal for noise, spike and power filtering applications in Power Supplies, DC-DC Converters and Switching Regulators.

- Operation over ambient temperature range from -55°C to +105°C
- All units are magnetically shielded
- All units exceed the requirements of MIL-T-27 (+130°C)
- Transformers have input voltages of 5V, 12V, 24V and 48V. Output voltages to 300V.
- Transformers can be used for self-saturating or linear switching applications
- Schematics and parts list provided with transformers
- Inductors to 20mH with DC currents to 23 amps
- Inductors have split windings

LITERATURE

Brochure Features Modular Computers

Modular Industrial Computers presents the features and specifications of the vendor’s integrated, industrial computers. The 14-pg brochure describes computers for compact, embedded applications, computers for rack-mount applications, and computers for factory applications that require a user interface and NEMA 4/12 specifications.

Our newest line of defense against heat.

Insist on Interpoint.

A full line of high-temperature DC-DC converters from the industry leader.

Get the hottest technology in board-mounted power supplies. Full military temperature range. Unsurpassed reliability. The lowest profiles. You can get it all with Interpoint's new line of DC-DC converters.

From arctic blasts to desert storms, Interpoint's new generation DC-DC converters stand up to the toughest military environments. They deliver full power over the entire -55° to 125° C temperature range. And over an unprecedented power range, too. Interpoint can now offer you an off-the-shelf hybrid power supply for any power level from 2 to 200 watts.

For more than a decade, Interpoint DC-DC converters have proven their reliability in many of the world's most advanced weapons systems — including mission-critical electronics on the Patriot and Tomahawk missiles, the Bradley Fighting Vehicle and F/A-18 aircraft. Our new generation converters are the most reliable yet. Each of them was designed with the specific intent of being qualified to the full performance and reliability standards of MIL-STD-883C.

And Interpoint continues to lead the way in power supply miniaturization. With power densities as high as 40 watts per cubic inch and package heights as low as .270 inch, this new generation of converters is built for the tightly packed boards in today's military and commercial avionics, ground vehicles and portables.

It's the hottest new technology in DC-DC converters. And it's available only from Interpoint. For more information, call 1-800-822-8782. In Europe, 44-276-26832.

Interpoint's new line of DC-DC converters features constant PWM switching frequencies from 500 to 700KHz. Built-in sync. Parallel operation. Up to 50 dB audio rejection. Line and load regulation as low as 0.1%. And full MIL-STD-704 input for 28- and 270-volt systems.

30 MS/s DSO PLUS A TEST BENCH OF FUNCTIONS TIED UP IN ONE PORTABLE PACKAGE.

Leader’s new battery-powered DSO/DMM weighs only 2.6 lbs., yet performs the functions of four different pieces of test equipment. Two functions the Model 300 offers are those of a DSO and DMM, with simultaneous display of each—including channels 1 and 2 peak-to-peak voltage and frequency. Two additional functions are an 8-bit logic analyzer, which lets you compare 8 signals at once, and a data logger for recording long-term phenomena.

The 300 has a remarkable sampling rate of 30 MS/s, giving you the ability to observe 10-MHz signals. A powerful 1.8k word/channel memory provides a detailed view of rapidly occurring events. A 20-waveform capacity is standard, but an optional IC card lets you store an incredible 80 waveforms. The IC card is especially handy for saving information and forwarding it to a lab for analysis. Although our new portable DSO is compact, it’s also feature-packed. Included are: HF rejection, add and subtract, and full auto setup for vertical sensitivity, sweep speed, vertical position, and trigger level. For documentation purposes the 300 can interface with an optional dedicated printer (Leader Model 710). A supertwist LCD display (a full 2 1/2” x 4 1/2”) provides high contrast and a large viewing angle.

You’ll find that the 300 makes the perfect traveling companion, letting you travel light without leaving a single vital function back in the shop. For our full-line catalog, in NY call 516 231-6900. Or call toll free: 1 800 645-5104.

CIRCLE NO. 187
Versatility was a prime consideration as we developed our Symmetrical Slotted Shielding Series.

For low force, secure mounting, and optimum attenuation, the gasket design is symmetrical. Each gasket has a wide radius profile to create the greatest surface contact for maximum conductivity and increased cycle life. It also helps reduce compression requirements down to 10 to 35 lbs/linear foot, and provides a compression range up to 50% of free height.

In addition, the gaskets are bi-directional, allowing transverse movement in each direction over the width of the strip.

By design, you're assured of shielding effectiveness at a minimum of 100 dB at 100 MHz. And you have a choice of mounting methods: Sticky Fingers® self-adhesive backing for non-wiping applications, or rivet mounting where bi-directional stability is a requirement.

Next time you need the perfect blend of form, fit, and function in your EMC designs, draw one of our Symmetrical Slotted Shielding gaskets onto your blueprint. For more information, call us.

**MacABEL**

PLD Design on the Apple Macintosh!

Data I/O's industry-standard ABEL PLD design package is now available on the Macintosh, exclusively from Capilano Computing!

- Use Boolean and integer equations, state machines and truth tables to describe your design
- Communicates directly with any serial PLD programmer
- Best device support in the industry, including ALTERA, AMD, ATTEL, CYPRESS, GOLD, HARRIS, ICL, INTEL, LATTICE, NATIONAL, PRCOH, SAMSUNG, SGS, SIGNETICS, SSD, TI, VTI and others
- Interactive 'in-circuit' schematic entry and simulation when used with DesignWorks

Call (804) 669-3434 today for your free demo kit!

Capilano Computing
Fax (604) 669-9521

**END WARPAGE WITH BOARD STIFFENERS**

- Rigidize board during, after assembly
- Prevent vibration and shock damage
- One-step installation requires no hardware
- Use as ground or carry up to 64 amps

Send for Rogers Board Stiffeners Application Bulletin.
Rogers Corp., 2400 S. Roosevelt St.
Tempe, AZ 85282
602/967-0624

**Design PLDs**

with ABEL-PLD, now just $495.*

- FREE ABEL-PLD start-up kit!
- 150 PLD architectures supported (over 4000 devices)
- Uses ABEL™ Hardware Description Language (ABEL-HDL™)
- Intelligent synthesis and optimization
- Upgradable to full-featured ABEL

Call for your FREE ABEL-PLD start-up kit!

EP-1140
$895

A programmer is not just another programmer. That is why BP Microsystems is committed to bringing our customers the highest quality programmers at an affordable price. This commitment is evident in our EP-1140 EPROM programmer supporting thousands of 24-, 28-, 32- and 40-pin devices. A 35-pin model, EP-1132, is available also for SFR. And, all of our programmers include future chip support at no charge and an unconditional money back guarantee.

SMD PICOFUSE™ AVAILABLE FROM LITTELFUSE

New PICO-SMD™ very fast-acting and Slo-Blo® surface mount fuses are available from Littelfuse, Inc.

The PICO-SMD fuses are available from 1/16 ampere to 5 amperes in the very fast-acting type and 3/8 amperes to 5 amperes in the Slo-Blo type. The interrupting rating for the very fast-acting fuse is 50 amperes at 125VAC and 300 amperes at 125VDC, the Slo-Blo fuse is 50 amperes at 125VAC and 150VDC.

Recognized under the components program of Underwriters Laboratories and Certified by CSA, the fuses are supplied on 12mm tape, 500 fuses per reel for use with automatic placement equipment per EIA Standard 481-1.

Littelfuse Inc.

Surface Mount Chip Component Prototyping Kits

Only $49.95

CC-1 Capacitor Kit contains 365 pieces, 5% of every 10% value from 1 to 33uf. CR-1 Resistor Kit contains 1540 pieces, 10% of every 5% value from 100 to 50meg. Sizes are 0805 and 1206. Each kit is ONLY $49.95 and available for Immediate One Day Delivery!

Order by toll-free phone, FAX, or mail. We accept VISA, MC, AMEX, COD, or Pre-paid orders. Company P.O.'s accepted with approved credit. Call for free detailed brochure.

PC/AT™ COMPATIBILITY ON MULTIBUS

In 1989 our MAT286™ SBC brought PC-DOS to Multibus I. Since then no competitor has come close in terms of features, price, or technical support. We've added capabilities, such as 8 megabytes of onboard EPROM capacity, MATxSSD Solid-State Disk software, EMS 4.0, and low power CMOS components. Now we are announcing our new MAT128/64D8 mothercard with 16-bit VESA and CGA/Tait panel interfaces, 1-1 interleave MT-RLL, 150ns hard-disc/hp floppy disk controller, and a PC/AT bus short-card adapter. And, yes, we are working on MAT386, the 386-based Multibus AT that will be compatible with the 286-based standard, MAT186.

Phone (408) 253-0250 for more information.

Peak performance under extreme conditions.
NEC's SVH-Series chip tantalum capacitors scale new heights of performance and reliability for automotive and other tough applications.

Our SVH capacitors offer a failure rate of just 0.5% per 1,000 hours. If obstacles like excessive heat and humidity seem insurmountable, don't worry. SVH caps withstand 1,000 temperature cycles from -55°C to +125°C. Their humidity resistance is 85°C, 85% RH for 1,000 hours.

We offer 29 types with ratings from 0.1 to 33 µF, and from 10 to 35 V DC.

A top-quality team of chip tantalum caps.
Reliable NEC caps also come in a wide array of device types.
Our diversified lineup includes:
- R-Series
  - 96 types.
  - 0.01 to 68 µF; 4 to 35 V DC.
- R-Series Extended-Capacitance
  - 58 types.
  - Up to 15 µF rating for A case (1.6 x 3.2 x 1.6 mm).
  - 0.1 to 100 µF; 2.5 to 35 V DC.
- SVH-Series
  - Built-in fuse; 21 types.
  - 1.0 to 33 µF; 10 to 50 V DC.
  - R-Series compatible.

Reward yourself with reliability.
NEC produces 2 billion tantalum caps per year—more than anyone else in the industry. Our path-breaking R&D effort covers everything from improving materials to enhancing design and production processes.

That's why we lead the industry with high-performance tantalum capacitors such as the ultra-reliable SVH-Series.
POWER POSITION

Currently, we have positions available within two dynamic and growing groups. Our entry-level products group designs microprocessors for the portable, notebook and palm top computer markets of the future, communication components, and Intel network cards. The microprocessor group is responsible for high-end microprocessors, bus chip sets, and peripheral component products for the PCs and workstations of the future.

System Architects
Combine customer needs with emerging technologies to define future system requirements. Interact with Design and Marketing to determine cost/performance trade-offs, and create the optimized component-level partitioning. Define the components and follow-up through implementation. Keep up with market requirements to create derivative products. Specific development areas are high integration desktop, notebook, and palm top computers, and multi-processor servers.

Component Design Engineers
Join a team designing peripheral devices for a wide range of single or multiprocessing applications on the PC, workstation and high-end system areas. Responsibilities include CMOS, VLSI component design on products such as mp chips, EISA bus chips, DMA controllers, or cache controllers. Requires a BSEE/CE, or equivalent, and a working knowledge of computer architecture and system design concepts preferred.

Product/Test Development Engineers
Develop and improve test solutions for current and future generation microprocessor/peripheral products. Responsibilities include test development, establishment of DFT/DFM requirements and test vector simulation/validation. Requires a BSEE/CE or equivalent, and a working knowledge of logic simulation environments, vector development, and fault grading/fault coverage improvement techniques.

If you are interested in a power position with Intel, plus live in an area with many outdoor recreational choices, great scenery, and less traffic, please send or FAX your resume to:
Intel Staffing, P.O. Box 1141, Dept. F893, Folsom, CA 95630, FAX (916) 351-5522.

Intel Corporation is an equal opportunity employer and fully supports affirmative action practices. Intel also supports a drug-free workplace and requires that all offers of employment be contingent on satisfactory pre-employment drug test results.

UNIX is a Trademark of AT&T.

DELL IS TO COMPUTER DESIGN
AS AUSTIN IS TO LIVING

At Dell, we believe in letting the imagination of our engineers shape the design of our award-winning products.

From the desktop-class power of our sleek 80386SX-based 316LT laptop, to the integrated math coprocessor and built-in UNIX compatibility of our new 80486-based 425E, Dell engineers enjoy a technical environment virtually free from the bureaucratic hassles of most large corporations.

So you get to focus on the things that really matter – designing better computers.

And beyond our unique engineering environment we also offer a truly unique living environment in Austin. With scenic foothills, a relaxed culture, lower cost of living and a variety of beautiful neighborhoods, the lifestyle in Austin beautifully complements the engineering lifestyle at Dell.

ENGINEERING
• Personal Computer Motherboard Design
• Laptop Display Systems
• UNIX Development
• Personal Computer Network Development
• Design for Manufacturability
• EISA BUS Logic Design
• Mechanical Engineers
• Failure Analysis Engineers

If you’re an engineer with a minimum of 2 years of computer industry experience and a related degree, learn more about the advantages of Dell in Austin.

Please fax or mail your resume with a cover letter to: 512/343-3330, Dell Computer Corporation, Jerry Holt, Human Resources, Professional Employment, Department EDN62091SG, 9505 Arboretum Boulevard, Austin, Texas 78759

Dell is proud to be an equal opportunity employer.
SEMICONDUCTOR OPPORTUNITIES

United Technologies Microelectronics Center (UTMC) is a major source of custom and semicustom VLSI circuits for the high-reliability marketplace. We design, fabricate, assemble, and test high-reliability ICs for military and aerospace markets.

Product Engineer
Support new technology development, qualify, yield enhancement and perform PE functions for prototype and production parts. BSEE with minimum 2 yrs exp. ATE experience required.

SPC Statistician
Responsible for implementation of SPC programs to include all coordination and training activities. PhD required. Minimum 5 yrs exp.

Manager, Quality Assurance
Plan, develop and manage quality assurance efforts to support manufacture and delivery of UTMC products to military and customer specifications. Technical degree with minimum of 5 yrs exp.

CAD System Development And Support Engineers
Participate in the creation, selection, integration, test and support of current and new digital simulation tools, ASIC design tools within the CAD design system, both VAX and workstation-based. BSEE or BSCS with 2/6 yrs of CAD or programming exp. MSEE or MSCE. Familiarity with VAX/VMS, UNIX*/ULTRIX, and engineering workstations required; exp. with digital logic, fault simulation, ASIC place and route and timing analysis.

Sr. Device Engineer
Perform device characterization and analysis. Design and analyze experimental designs. Develop SPICE models for CMOS technologies. MSEE or PhD. Minimum 5 yrs exp. Familiarity with CMOS characterization techniques, experimental design and SPICE model extraction required.

Sr. Process Engineer
Engineering sustaining and process development opportunities in etch and lithography. Working with CMOS 0.8/1.2 micron technology on bulk and SOI. Minimum of 5 yrs exp. in Photolithography and/or Plasma Etch. Strong background in SPC/statistically designed experiments required. Solid experience in manufacturing sustaining and process development in an ASIC environment is desired.

RH SRAM Product Engineer
Performs variety of duties including product development, evaluation, characterization, introduction, and manufacturing support for the Memory product family. BSEE or MSEE preferred. Minimum 5 yrs exp. with RAM products and Radiation Hardened products in Design or Product Engineering environment required. Previous experience with Memory test equipment would be a plus.

UTMC offers a highly competitive salary and benefits package and the opportunity to advance in a dynamic environment. Interested individuals should send resume with salary history to UTMC, Department EDN, 1575 Garden of the Gods Road, Colorado Springs, Colorado 80907. (U.S. citizenship required.)

We are an equal opportunity employer M/F/H/V.

*United Technologies Microelectronics Center.

At COULTER®, we set standards — in what we do and how we do it. As the internationally acclaimed world leader in the field of biomedical instrumentation and automated hematology, we attribute much of our success to our commitment to quality, reliability and teamwork.

The following Engineering opportunities are currently available:

Software Engineers
Mechanical Engineers
Quality/Reliability Engineers
Manufacturing/Productibility Engineers

All positions require a minimum of 5 years experience. Only seasoned professionals need apply.

If you are interested in a career with stability and growth potential, consider the Company with a commitment. Consider Coulter.

We offer excellent salaries and benefits including negotiable relocation. Please send your resume to: Employment Manager, Coulter Corporation, Dept. EDN, 650 West 20th Street, Hialeah, FL 33010. Principals only — no agencies please. An Equal Opportunity Employer.

COULTER

If You’re Looking For a Job, You’ve Come to The Right Place.

EDN CAREER OPPORTUNITIES
In the world of electronic defense systems, being good isn’t good enough. It takes a company-wide commitment and the very best professionals to put technology on target.

At E-Systems Garland Division, we understand that to succeed in the complex world of electronic defense, we’ve got to be better than good. We’ve got to go one step beyond—to redefine the meaning of excellence. That’s because there are no near-misses in our business. Only bulls-eyes. And bulls-eyes on bulls-eyes.

So it’s no accident that we’re one of America’s fastest growing suppliers of electronic defense systems. Outstanding systems, products and technologies come from superlative professionals.

E-Systems Garland Division is a Dallas-based leader in advanced signal and image processing technologies, sophisticated receiver systems, and systems integration for programs like JSIPS and the Distributed Wargaming System.

Be outstanding in your field.

If you’re a technical professional, we invite you to stand out with E-Systems Garland Division.

Management Information Systems

- Business Systems Programming
- IDMS/Cullinet

Senior Software Engineers

- UNIX, “C”, Ada, Pascal
- X-Window
- 68000 Firmware

Fasten your seat belts. The HPR2XX takes your designs on a power trip with the equivalent of 4 DC/DC Converters in one. This tiny Power Convertible in a SIP package has four isolated output channels. Each channel has a plus and a minus voltage output and produces 750 mWatts of unregulated power. Your total conversion package is 3 Watts of power.

With a sticker price of less than $15.00 (5K pcs. U.S.A.) it is the lowest cost per channel in the industry (less than $4.00).

Drop-in board level parking is easy, using less than 0.2inch² per channel.

Shift your design into overdrive with one Power Convertible for reliability in your multi-channel applications.

BOARDSCAN

They're everywhere...
They're the bugs that sabotage PCB design and cause costly prototyping and time consuming board iterations.

Until now, restrictive formulas and topologically-based rule violation tools were the solution.

Home and office bug killer!

Quantic Laboratories has now given PCB and digital logic designers the advantage... BoardScan Version 2.0... the most powerful screening tool today. This second generation breakthrough is an automated printed circuit screener that calculates both transmission line signal and crosstalk effects with the same tool.

With its unique signal integrity calculations BoardScan offers customers a new functionality. This includes the reporting of time delays, over- and under-shoots, settling time, noise margins, and functional violations.

When combined, BoardScan and Greenfield offer full-spectrum transmission-line simulation capability for swatting bugs "across-the-board".

EDN's CHARTER

EDN is written for professionals in the worldwide electronics industry who design, or manage the design of, products ranging from circuits to systems.

EDN provides accurate, detailed, and useful information about new technologies, products, design techniques, and careers.

EDN covers new and developing technologies to inform its readers of practical design matters that will be of concern to them at once or in the near future.

EDN covers new products
• that are immediately or imminenty available for purchase
• that have technical data specified in enough detail to permit practical application
• for which accurate price information is available.

EDN's Magazine Edition also provides specific "how to" design information that its readers can use immediately. From time to time, EDN's technical editors undertake special "hands on" engineering projects that demonstrate EDN's commitment to readers' needs for useful design information.

EDN's News Edition also provides comprehensive analysis and news of technology, products, careers, and distribution.

Surge Protection for AC Power Lines

Starts at $80.00

A large percentage of equipment malfunctions are due to the failure of sensitive semiconductor devices when exposed to transient overvoltages. MCG Electronics Inc. has a series of low profile AC power line protectors designed specifically for the needs of the OEM user. They are available in 120VAC in 7.5A, 15A and 25A and 240VAC, 25A. Models 407, 415, 416, 417 offer compact, cost-effective protection designed to be incorporated into original equipment. The units employ a sophisticated blend of high speed clipping and filtering to reduce IEEE 587 Cat. B impulses (6000V/3000A) to less than 350V peak between line and neutral.

Easy, Plug-In Solutions

The world of DSP is far from simple. You need a secret code book to wade through its bevy of acronyms, a doctorate in mathematics to create its complex algorithms, and years of signal processing expertise to develop the necessary hardware.

Or you need Burr-Brown. We've developed a line of easy, painless, plug-in solutions that lets you concentrate on your application instead of the hairy details.

From Chips to Systems
• Need a direct interface ADC or DAC for one of today's DSP processor chips?
• Need a DSP processor for your VME or PC platform?
• Need one with high speed, high accuracy data conversion, single channel or multi-channel, or high dynamic range?
• Need an easy way to create and execute DSP algorithms?
• Need an inexpensive and simple approach to analyzing your analog signals?
  • Need a custom solution?

We have your solution waiting, in most cases, from off-the-shelf.

Over 30 Years of Signal Processing

Ask around. We've been making and delivering high performance precision microelectronics for over 30 years to a worldwide customer base. We're known for the highest performing data conversion products for signal processing available, and since 1986, engineers have known us for some of the best DSP tools around.

For more information about our product line or for a copy of our free brochure, call 1-800-548-6132, contact your local salesperson, or write:

With our new metal latch SIMM* sockets, we've improved one of our greatest inventions.

At least in recent memory.

Invent. Then improve. That’s the Molex approach—and the new connectors for SIMM memory package systems are the latest examples.

First, they feature two extra-strength stainless steel mounting latches. These lock modules firmly in place, and tell you, with an audible click, when they are positioned correctly. They allow easy upgrading, and guard the assembly against overstress and abuse.

SIMM sockets also provide two contact points per readout for added reliability. In fact, the contacts are guaranteed with any standard module board (.047" to .054").

Made with high temperature-resistant liquid crystal polymer housings, SIMM sockets come in .050" and .100" pitch, and are available in a broad range of configurations: single and dual row, verticals, low profiles, and right angle. Call today for more information.

molex

Bringing People & Technology Together, Worldwide®
All OEM modems start out even

A limited amount of board space and a fixed agenda of performance parameters — these are the design starting points for every add-in modem. Since they all start out even, how do smart OEM customers gain an advantage?

They buy experience. UDS has more than 4,000 successful custom modem designs already in the field.

They buy engineering expertise. More than 200 UDS engineers keep our OEM customers at the forefront of new modem developments and design refinements.

They buy manufacturing skill. UDS has more than 300,000 square feet of factory space, a full complement of automated manufacturing tools, and a dedicated workforce that uses these resources for the OEM customers’ advantage.

They buy a fanatical concern for quality. As a dedicated participant in Motorola’s Six Sigma quality assurance program, UDS uses every technique from incoming component qualification to an exhaustive suite of pre-shipment tests. The result: the kind of consistent quality that helped Motorola win its recent Baldridge award.

The modems you add in can give your product a distinct advantage. Let a UDS sales representative show you how. Contact UDS, at 800/451-2369 (in Alabama, 205/430-8000); FAX 205/430-8926.

CIRCLE NO. 203
NEW DUAL BOBBIN DESIGN TRANSFORMERS.

ONE-4-ALL™ TRANSFORMERS FEATURE HIGH ISOLATION FOR TRIPLE OUTPUT REGULATED POWER SUPPLIES IN MICROPROCESSOR APPLICATIONS.

Once again, Signal “The American Original” comes through with a complete line of 50/60 Hz transformers for triple-output regulated supplies. These new “one-4-all™” transformers feature the same dual high-temperature bobbin construction and insulating shroud originally developed for the company’s very successful International Series. Because they have high isolation and reduced interwinding capacitance characteristics, and require no electrostatic shield, the transformers are an ideal low noise alternative to multi-output switchers. They satisfy UL 506 requirements, and CSA safety and performance standards.

Offered in PC and chassis mount versions, the “one-4-all” has dual complementary outputs (±15 VDC and ±12 VDC) and additional isolated single output for ±5 VDC with in-circuit performance specs.

Signal transformers are available through Signal’s PRONTO 24-Hour Off-the-Shelf shipment program. For additional technical data, contact Signal Transformer,

500 Bayview Avenue,
Inwood, N.Y. 11696.
