## PREFACE

Any comments and suggestions on this manual are welcome. Please address them to:

TeleVideo Systems, Inc.  
1170 Morse Ave.  
Sunnyvale, CA 94086

TeleVideo Systems, Inc. reserves the right to make improvements to products without incurring any obligation to incorporate such improvements in units previously sold. Specifications and information herein are subject to change without notice.

The material contained in this handbook is the property of TeleVideo Systems, Inc., and is not to be photocopied, duplicated or reproduced without the express written permission of TeleVideo Systems, Inc.

# LIMITED WARRANTY POLICY AND SERVICE OUT OF WARRANTY

## STATEMENT OF LIMITED WARRANTY

TeleVideo Systems, Inc. ("TeleVideo") warrants to its distributors, systems houses, and OEMs ("Buyer"), that products manufactured by TeleVideo are free from defects in materials and workmanship. TeleVideo's obligations under this warranty are limited to repairing or replacing, at TeleVideo's option, the part or parts of the products which prove defective in material or workmanship within 180 days after shipment by TeleVideo. Buyer may pass along to its initial customer or user ("Customer") a maximum of 90 days coverage within this 180-day warranty period, provided that Buyer gives TeleVideo prompt notice of any defect and satisfactory proof thereof.

Products may be returned by Buyer only after a Return Material Authorization number ("RMA") has been obtained from TeleVideo by telephone or in writing. Buyer will prepay all freight charges to return any products to the repair facility designated by TeleVideo and include the RMA number on the shipping container. TeleVideo will, at its option, either repair the defective products or parts or deliver replacements for defective products or parts on an exchange basis to Buyer, freight prepaid to the Buyer or the Customer. Products returned to TeleVideo under this warranty will become the property of TeleVideo. With respect to any product or part thereof not manufactured by TeleVideo, only the warranty, if any, given by the manufacturer thereof, applies.

## Exclusions

This limited warranty does not cover losses or damage which occur in shipment to or from Buyer or Customer, or are due to, (1) improper installation or maintenance, misuse, neglect or any cause other than ordinary commercial or industrial application, or (2) adjustment, repair, or modifications by other than TeleVideo-authorized personnel, or (3) improper environment, excessive or inadequate heating or air conditioning and electrical power failures, surges, or other irregularities, or (4) any statements made about TeleVideo's products by salesmen, dealers, distributors or agents, unless confirmed in writing by a TeleVideo officer.

If the firmware or hardware is altered or modified by the Buyer or Customer, this firmware and hardware is not covered within this limited warranty and the Buyer or Customer bears sole responsibility and liability for that firmware and hardware.

THE FOREGOING TELEVIDEO LIMITED WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, WHETHER ORAL, WRITTEN, EXPRESSED, IMPLIED, OR STATUTORY. IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE DO NOT APPLY. TELEVIDEO'S WARRANTY OBLIGATIONS AND DISTRIBUTER'S REMEDIES HEREUNDER ARE SOLELY AND EXCLUSIVELY AS STATED HEREIN.

TELEVIDEO'S LIABILITY, WHETHER BASED ON CONTRACT, TORT, WARRANTY, STRICT LIABILITY, OR ANY OTHER THEORY, SHALL NOT EXCEED THE PRICE OF THE INDIVIDUAL UNIT WHOSE DEFECT OR DAMAGE IS THE BASIS OF THE CLAIM. IN NO EVENT SHALL TELEVIDEO BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF USE OF FACILITIES OR EQUIPMENT, OR OTHER INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES.

## SERVICE OUT OF WARRANTY

If your terminal is out of warranty when it needs service, follow the same procedure to receive an RMA. You will be responsible for all shipping costs.

If your company requires a purchase order for out-of-warranty repairs, let us know the purchase order number when you call in. One purchase order may cover several repairs but we will give each unit its own individual RMA number. This allows us to return each unit quickly without holding up the entire purchase order for one unit.

## EXTENDED WARRANTY

TeleVideo offers an Extended Warranty Agreement, which extends the terms of the above-stated Limited Warranty for an additional year. To take advantage of this Extended Warranty, you must sign the Extended Warranty Agreement and return it, together with full payment, to TeleVideo before the Limited Warranty expires. Shipping charges are not included in the Extended Warranty. This is normally the only expense you incur. Please contact the Customer Service department or your sales representative for details. To renew the Extended Warranty for another year, follow the same procedure.

## ORDERING SPARE PARTS

Order parts directly from the Terminal Division's Spare Parts Order Entry department in Sunnyvale, California. Call (408) 745-7760 or (800) 538-8725 (outside California). Please have the purchase order number and TeleVideo part number ready when you call. International customers can telex 910-339-9621, attention Terminal Spares Order Entry.

Contract customers and institutions can order parts on a purchase order and be invoiced. All other customers must order parts on a C.O.D. or cash-in-advance basis.

ALL orders (except manuals) have a \$50.00 minimum. Add 6.5% sales tax to orders placed in California. There is also a shipping and handling charge of \$10.00 per order. Since we do not make any drop shipments, please include the shipping and billing addresses with your order. Shipments are made Best Way, which is UPS. Although special shipping requests will be accommodated, any extra costs incurred will be added to the invoice.

## Regional Sales Offices

NOTES:

- 1) DEGREES REFER TO SCULPTURED/MATTED KEYCAPS ONLY
- 2) SLASH BETWEEN TWO CHARACTERS (ie: 1/!) IS FOR CLARITY AND IS NOT PRINTED ON KEYCAP
- 3) LOW PROFILE KEYCAPS
- 4) SAME KEYCAP CAN BE USED FOR ALL FOUR CURSER POSITIONS

## SPARE PART KITS

The following are the terminal spare part kits available through TeleVideo Systems, Inc. Each model terminal has been designated the following spare part kits:

- A) Main Logic
- B) Power supply/Video module
- C) Mechanical components
- D) Additional parts

The suggested stocking levels have been identified as follows:

For the first 50 terminals lea of kits A, B, C, & D are suggested.

For the next 50 terminals add lea of kits A, & B

For the next 50 terminals add lea of kits A, B, C, & D

For the next 50 terminals add lea of kits A, & B

The list price of the spare part kits (as shown on the Terminal Spare Parts Price List) reflect a 25% discount, if the items were purchased seperately.

\*Attached are the kits currently available through TeleVideo.

# **Terminal Maintenance Training Class**

---

- Subjects covered:** Basic Operation  
Theory of Operation  
Overview of Schematics  
Debug to Component Level  
Interface Considerations  
Installable Options  
Lab  
    Structured  
    Operations
- Material provided:** Maintenance Manuals  
Customer Service Notes  
Product Brochures  
Lunch Provided  
Certificate of Completion Awarded
- Price:** \$200.00 per person at TeleVideo Training Center  
\$1750.00 (plus travel expenses outside USA) per class  
on-site, plus \$100.00 per person over 10 students.
- Sign Up:** Classes are scheduled on a demand basis. To enroll,  
contact Customer Service, TeleVideo, Sunnyvale,  
(408) 745-7760.
- Fees:** All fees are due and payable 2 weeks prior to the first  
class session.

## MAIN LOGIC BOARD

### 4.1

#### Overview

Please refer to figures 1, 2, 3, and 4 of the block diagrams as you read the text that follows.

Figure 1 shows the power-on reset, which is controlled by A17. During power-up, this chip sends the signals necessary to reset the CPU and to perform the initial diagnostic routine. This routine reads the switches in the back of the terminal and configures it for the proper handshaking protocol.

The 950's CPU is a 6502, located at A53.

The Shift clock (OSC1) generates the timing for the 950's logic system. The Stretch clock functions as the main clock for the CPU. Other clock circuits include the Crystal clock to the UARTs, the Shift clock, the DC Carry clock, the C clock, and the QC clock.

The CPU's address bus (6502 bus) addresses the ROM chips (A41 and A42).

The ROMs contain the operating instructions, the power-up diagnostics, and the other instructions necessary to operate the terminal. Most systems only use two ROMs, but the 950 contains an additional, optional ROM (A52).

The decoding gates (A58 and A63) select one of the three ROMs. The other decoder (A62) selects either the DISP.MEM (display memory) or the IOP.SEL (input/output select) signal.

The auxiliary chip in this figure (6522) reads switches (S1 and S2), and generates the control signals for the video attributes and the bell, as well as several auxiliary control signals used to address the display RAM.

In figure 2 of the block diagram, note the continuation of the 6502 and the 6522.

The CRT controller chip (CRTC 6545) generates the signals necessary to control the monitor portion of the terminal. It outputs three primary signals: horizontal synch, vertical synch, and cursor. These signals go to the video module.

The display RAMs are addressed by the 14 address bits coming from the CPU bus, as well as the memory address bits from the CRTC.

The multiplexers in the center of the figure (A43 through A46) alternately select whether the CPU or the CRTC is permitted to address the system and the display RAMs (A25 through A28, A34 through A37).

The Phase clock controls this process. During one phase of the clock the CPU can address RAM. During the other phase, this multiplexer allows the CRTC to address RAM.

When the CPU addresses the system display RAMs, the bidirectional latch at A14 is enabled to either input or output data from the system RAMs. When the CRT controller addresses the RAMs, the latch at A24 holds the display data.

Normally, the outputs of the CRTC would be used for scrolling. However, since the 950 has a smooth scroll option, the output of the counter latches at the bottom of figure 2 (A60 and A61) are used to scroll. The CPU controls these latches through the decoder at A62.

In figure 3 of the block diagrams, the row address signals coming from these counter latches (A60 and A61) and the display data from the latch above it (A24) are used to address the character-generator ROMs (A32 and A33). The character-generator ROMs then output 14 bits to a parallel-to-serial shift register.

The DC.Carry signal loads these 14 bits at the shift register (A22 and A23), and the shift clock shifts the data into the video logic and the drivers as a serial data stream.

The eight bits of display data from latch A24, as well as one bit from the character generator ROMs, address the attribute registers.

The attribute registers' output also addresses the video logic and drivers, as do the video attribute signals sent by 6522. These signals (dark on light, cursor, force blank, blink rate, and maximum intensity) control the video attributes through the video logic and drivers. Note that, in the 950, the maximum intensity signal (MI) is standard. To highlight, the 950 uses half intensity. The output is routed to the video module.

The XTAL1 clock (clock source) controls the three UARTs on figure 4 of the block diagrams.

A49 receives data from the keyboard.

A50 receives and transmits data for the main port (P3).

A51 receives and transmits data for the printer port (P4).

## 4.2

### CPU Timing and Control

A 23.814 MHz. oscillator (OSC 1, sheet 6) generates the timing for the 950's entire internal logic system. Known as the Shift (or dot) clock, it drives the two shift registers (A22 and A23). These registers bring in parallel data and shift it out as serial dot data.

The active low\* shift clock is gated with the terminal count output of the C.clock (Character clock) counter. Together they drive a latch (A24, sheet 4) that holds data from character addresses 0 through 7, as well as the flip-flop (A31, sheet 4) that controls the DEL CURSOR signal.

A 4-bit binary counter (A3, sheet 6) divides the shift clock's rate by 14, creating eight 1.701 MHz clocks.

The C.clock, which is the time base for character generation, drives the CRT chip (6545, sheet 2). The active low C.clock has two purposes. It drives the Hex D flip-flops (A64 and A71) that time the CRTC RESET. It also controls the Stretch clock, which generates clock periods twice the normal length (1175ns vs. 588ns) upon command from the CPU.

This circuit (sheet 6) accesses slower memory or peripheral devices. The final output (called "00" or "Phase Zero clock") goes to the 6502 and all the peripheral chips. The Phase Zero clock controls the CPU bus timing, and it triggers all data transfers between the CPU and the other internal processors.

The DC.carry signals function as two clocks. The active high DC.Carry clock drives a flip-flop (A19, sheet 4) that is part of the video attribute circuitry. The active low DC.Carry clock is connected to the LD or Shift/Load enable lines (A22 and A23, pin 15, sheet 4) of two parallel-to-serial shift registers (A22 and A23). These registers are part of the character generation circuitry.

The XTALL clock drives UARTs A49, A50, and A51, which interface data to and from the terminal.

The QC clock combines with three RAM address lines (A15, sheet 3) to form a 1-of-10 decoder. The decoder's output goes to the chip select lines of each system RAM and each page of memory. The QC clock also deselects the RAM chips while the address lines are settling.

Line lock and smooth scroll are two 950 features not normally attainable with the 6545 CRT controller. To use them, additional circuitry is required.

\*The active low state is indicated by a bar above the signal name.

To achieve line lock, the top of the 6545's display register must be reloaded at the beginning of each character row. A general description of this circuitry follows.

To achieve smooth scroll, a CPU-loadable count-up counter (A60, sheet 4) must replace the 6545's internal scan line counter.

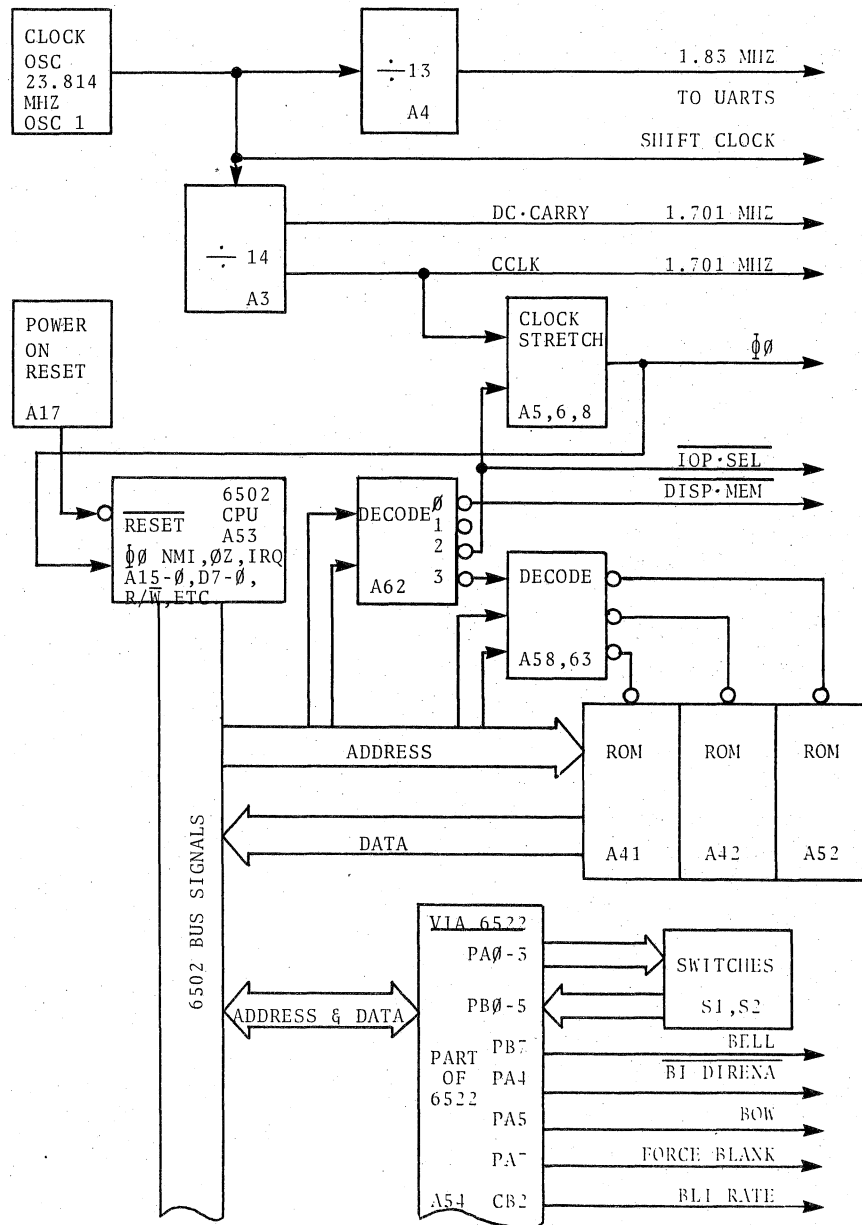

Figure 1 CPU, Timing, and Control

## 4.3

### Display Controller

The 6545 (A55) generates each character's memory address in the display RAMS (A25 through A28) as it is to be displayed. It also generates the horizontal and vertical synchronization (synch) pulses necessary to control the deflection circuits of the monitor (CRT).

Note! In the text that follows, the term "scan line" refers to one of ten scan lines created by the electron beam, which makes up one data row.

The 6522's timer (T2) counts horizontal scan lines. When a specified number of scans have been executed, it interrupts the CPU (6502) with the NMI-interrupt. The CPU then loads the memory address of the next data row into the CRT controller (6545).

At the same time the NMI-interrupt is issued to the CPU, the CRTC reset timer (A64 and A71, sheet 7) is cleared, causing it to reset. The reset is released after seven C.CLK periods, and the CRTC starts timing the next character row. This operation allows the CPU to determine the order of the display lines so that some lines can be locked while others scroll.

To achieve a smooth scrolling effect, the number of scan lines in the character row and the starting scan line of each row must be specified.

The 6522's timer, which counts horizontal synch pulses, specifies the number of scan lines in the present character row. Normally, ten lines are used when smooth scroll is disabled. During a smooth scroll, this number ranges between 1 and 10 on the top and bottom rows.

To do this, the processor loads a 4-bit value into a latch (A61, sheet 4). When the CRTC is reset, this value is transferred to the counter (A60, sheet 4) and becomes the first scan line of the next data line. Each horizontal synch pulse then increases this value until the start of the next data line. At that point, it is preset again to a value determined by the CPU.

The CPU and the display controller share access to the system and display RAM during the alternate phase of the 6502's Phase 2 clock.

During the positive portion of the Phase 2 clock, the CPU address can be gated onto the RAM address bus through multiplexers (A43 through A46, sheet 2). A bidirectional transceiver (A14, sheet 3) passes data between the CPU data bus and the RAM data bus.

During the negative portion of the Phase 2 clock, the 6545 address bus (A55) is gated onto the RAM address bus, allowing the video data to be loaded into a latch (A24, sheet 4). This address becomes the input for the character generators and the attribute generation circuitry.

This alternating ("interleaved") access allows the processor to operate at normal speed without interruption or degradation of the display quality (which could be caused by accidental appropriation of the display bus by the processor as it accesses data).

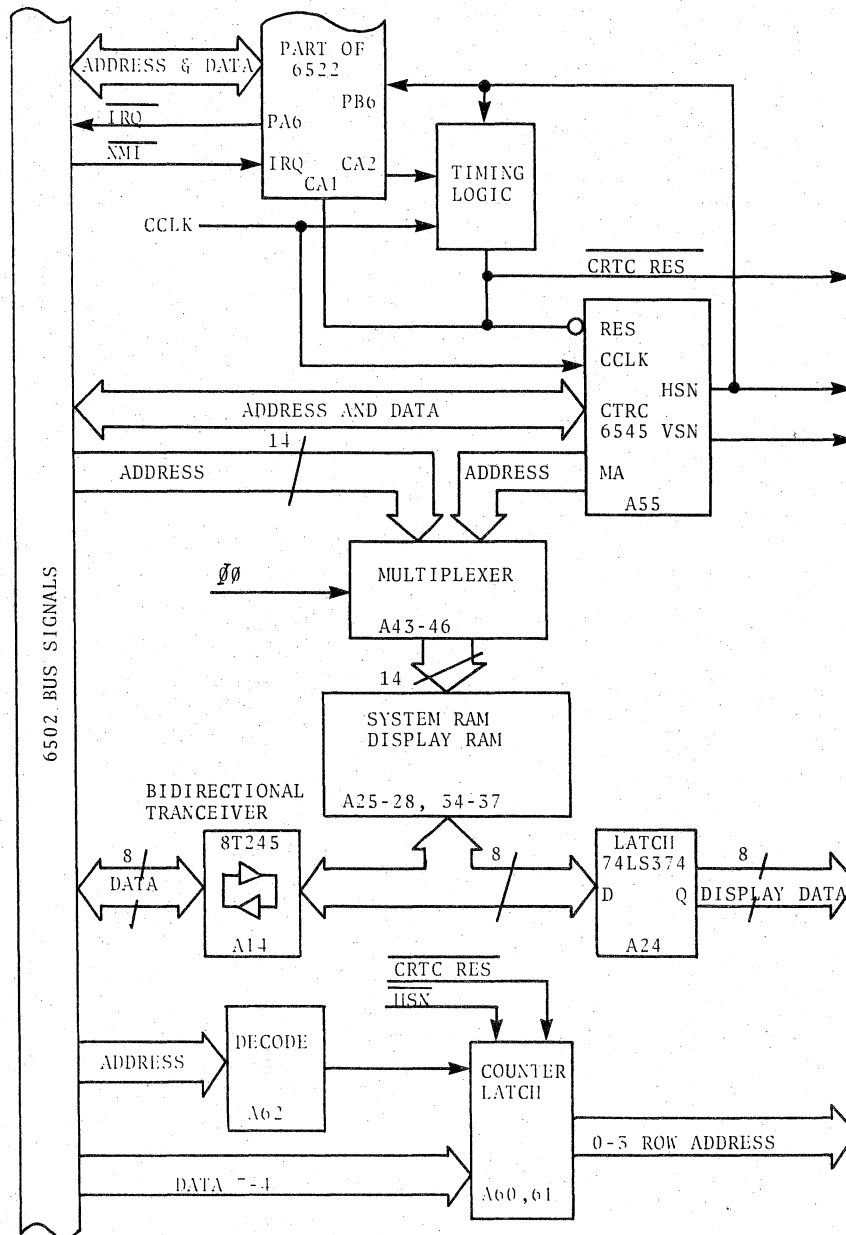

Figure 2 Display Controller

## 4.4

### Video and Character Generation

To create the 950's display, the CRT scans horizontally from left to right, and vertically from top to bottom. Depending on the terminal's Hertz setting, the scan consists of 250 horizontal scan lines, each repeated 50 or 60 times per second. Each scan line displays 80 sections of 14-dot pixels. Each character line contains ten horizontal scan lines. This makes each character cell 14 pixels wide by 10 pixels high.

Characters are formed when the electron beam turns on individual pixels. The CRTC "MA" lines access the display memory once each character time (14 dot clocks). Once each cycle, the data from the display memory is then latched by the character address latch (A24, sheet 4). The output from this latch drives the eight most significant address lines of the character generator ROMs (A32 and A33, sheet 4).

The scan-line counter controls the four least significant address lines of the character generators. The scan-line counter's output changes only at the end of the scan line, when horizontal synch goes high.

The character generator's output is a 14-bit word that represents the pixel pattern to be displayed. The Shift clock loads this word into a 14-bit parallel-in/serial-out shift register (A22 and A23, sheet 4), and shifts it out, one bit at a time.

Thus, as the present pixel pattern of one character is loaded, the character address of the next character is latched. The bits shifted out of the shift register are mixed with display enable and the cursor and attribute data, creating the video output to the monitor. This signal turns the CRT's electron beam on and off as the beam sweeps the raster.

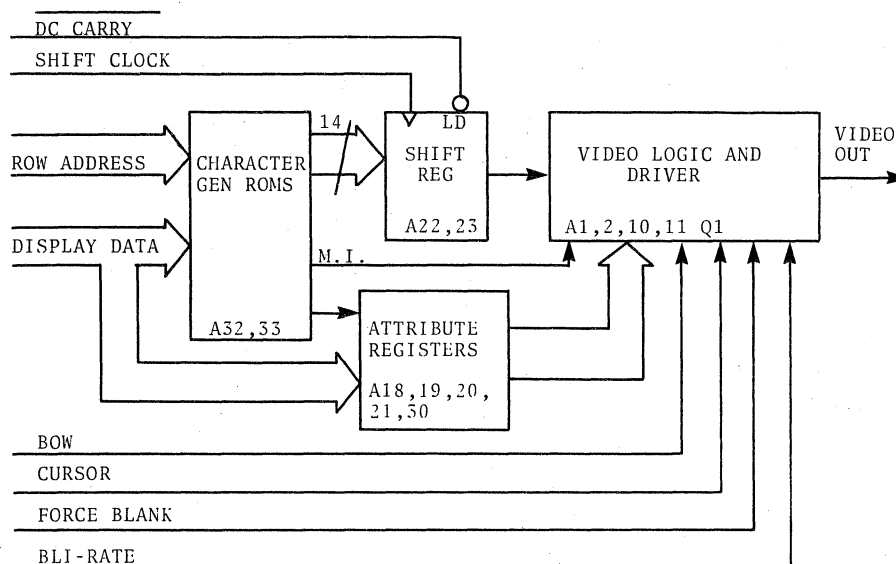

Figure 3 Video and Character Generation

## 4.5

### Visual Attributes

The 950 has five visual attributes: half intensity, blink, blank, underline, and reverse video.

The only attribute created on a character-by-character basis is half intensity. All other attributes are "field" attributes; i.e. they have a specified starting and ending point. All characters between these points are affected by the attribute selected.

In the 950, attributes are stored in the display RAM just like displayed characters. An attribute character occupies a character space on the screen and is displayed as a half intensity space. The attribute becomes active immediately to the right of that space and remains in effect until the end of the screen.

Since an attribute is stored as a character in the display RAM, the character generation logic processes it as though it were a displayed character. However, the byte stored in RAM for an attribute character differs from that for a display character in that bits 4 and 7 are always set, while bits 5 and 6 are always reset.

Bits 0 through 3 define the active attribute. When the low-order character generator ROM (A33, sheet 4) is accessed by these codes (90 through 9F), the resulting data bit (A33, pin 17) is output as a high.

A21's data input comes from the output of a four-channel, two-to-one multiplexer (A20). While nonattribute characters are displayed, the multiplexer is driven by the output of A19. During an attribute character time, the output of Nand gate A11 is low, and it selects the A input to the multiplexer. This input connects with the output of the And gates that compare the previous attributes (output of A21) to the new attributes (output of A24).

If the previous attribute bit and the corresponding bit of the new attribute are both high, the output of the And gate is high. If one or both are low, the output of the And gate is low and the attribute is turned off.

Thus, if an attribute is true for both the previous attribute and the new attribute, it is true while the new attribute is displayed on the screen. Otherwise, it turns off when the new attribute character starts.

The 950's attributes continue from character line to character line. Since any attribute on the previous line must be displayed on the current line until a new attribute is found, the logic must remember the last attribute of the previous line.

To summarize, A21's output is used by the video logic to turn visual attributes on or off. Its input can come from two sources: the output of the AND gates and the output of A19.

The output of the And gates defines the attribute(s) to be displayed during the attribute character, while A19's output determines the attribute(s) to be displayed during a nonattribute character.

A19's output is set to equal the previous character line's attribute until a new attribute is encountered. At that time, the output changes to the new attribute. A18 is used to remember the last attribute of a character in any character line.

Since each character line contains ten scan lines, the attribute data changes ten times. At the end of the displayed portion of each scan line, the Display Enable signal changes from high to low. This signal is then inverted and fed into a two-input Nand gate with the Delayed Display Enable signal, which changes one character time after Display Enable. Both signals are high only during the 81st character time of each scan line, creating a low pulse on the output of the Nand gate (A13 and A11). This pulse enables the output of a tri-state latch (A18).

A18's input comes from A20 and is latched only during the last scan line of the character row (pin 9, clock enable). This "remembers" the last attribute data of any character line. A18's output is latched into A19 at the end of the displayed portion of each scan line. A19's output then defines the attribute to be displayed during the current nonattribute character time.

The signals for Delayed Display Enable, Delayed Cursor, Dot Serial, Bow, Force Blank, and Visual Attribute Data are combined on sheet 6. They are gated together through A1, A9, A10, and A11, and are amplified to proper voltage and current levels by an NPN transistor Q1 (sheet 6). This transistor drives the video signal to the video module and/or external monitor (i.e. composite video).

## 4.6

### Input/Output Circuits

Each of the three peripheral ports is controlled by a separate 6551 UART.

UART A50 receives and transmits data for the main port (P3)  
UART A51 receives and transmits data for the printer port (P4)  
UART A49 receives data from the keyboard

The UARTs receive serial data, convert it to parallel data, and tie it directly to the CPU's data bus with input drivers, receivers, and switching circuits (A39, 40, 47, 48, 56, 57, 58, 50, sheet 5).

The use of separate UARTs for the P3 and P4 ports allows the setting of different baud rates for each port.

The 1489 quadruple input line receivers (A57 and A40) convert RS232C voltage levels to TTL voltage levels. The 1488 quadruple output line drivers (A48 and A39) convert TTL voltage levels to RS232C voltage levels.

The output of A59, a quadruple 2-to-1 multiplexer, selects the output line drivers. A59 can select between two inputs (A or B), and route it to its respective outputs.

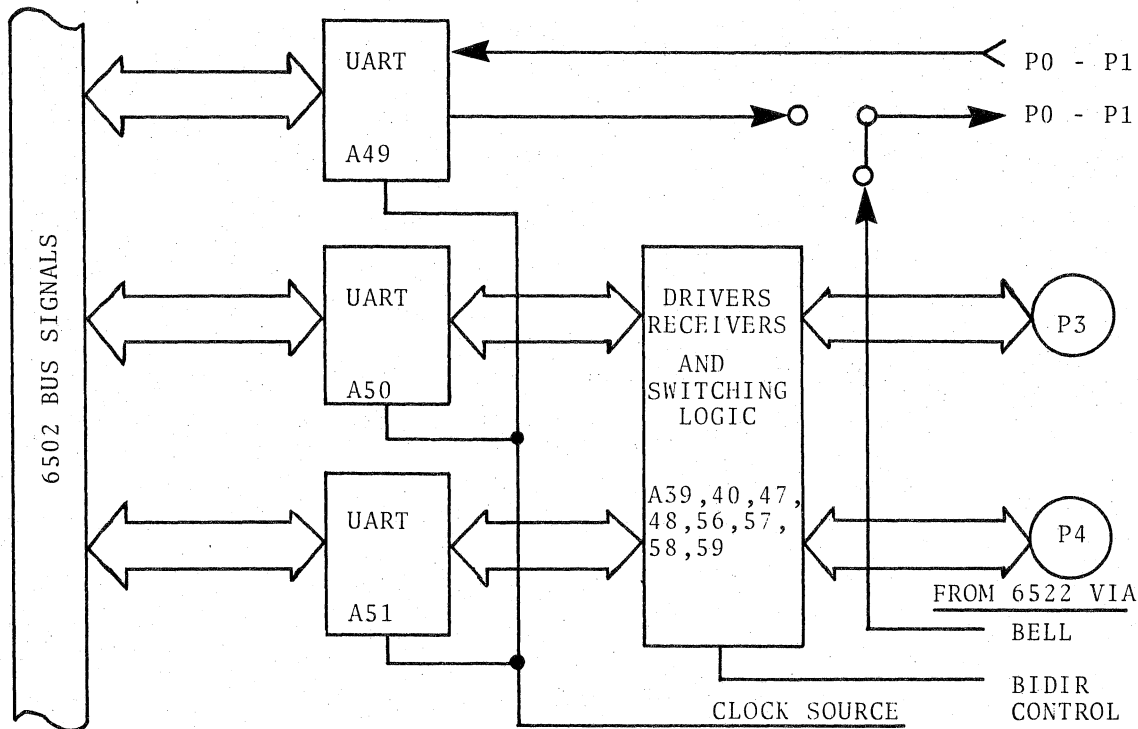

Figure 4 I/O Circuits

## KEYBOARD

### 4.7

#### Overview

The 950 contains a microprocessor-based keyboard. The firmware monitors keyboard scanning, return-line testing, and communication with the control board.

In addition to the standard keyboard, additional parts let you create a keyboard that allows new key codes to be programmed into the keyboard PROM (2716).

#### Standard Keyboard (Version 1)

- . Requires 5 volts (typical input current = 80 milliamps)
- . 8048 microprocessor
- . 1k byte ROM capacity (internal to the 8048)
- . Asynchronous serial transmit and receive
- . Baud rate = 1200 bits/sec.
- . Word structure = 1 start bit, 8 data bits, 1 stop bit

#### Version 2 Keyboard with EPROM

- . Requires 5 volts (typical input current = 150 milliamps) .
- . 8035 microprocessor
- . 2K x 8 byte EPROM 2716 (external to 8035)
- . Status display - 8 LED display
- . Asynchronous serial transmit and receive
- . Baud rate = 1200 bits/sec.
- . Word structure = 1 start bit, 8 data bits, 1 stop bit

The Version 2 keyboard with the 2716 EPROM requires a larger memory map and storage capability in the microprocessor. Therefore, you must also change the standard 1K x 8B 8048 microprocessor to a 2K x 8B 8035.

To install it, cut jumpers A through M on the circuit side of the logic board and install the following components in the appropriate locations.

#### Components

U2,U3	74LS367
U4	75L5373
U5	EPROM (2716)
U7	74LS05
C2,C3	{.01uf cap}
C4,C5	{10% 50V}
R2	1K 5% 1/4 watt

4.8

Keyboard Layout

The keyboard contains 101 keys on a PC board, as shown in Figures 5-A and 5-B.

The key switches are arranged in an X-Y matrix (Figure 6). Only four special keys (CTRL, SHIFT, FUNCT, and ALPHA LOCK) are not included in the X-Y matrix.

Figure 5-A Keyboard Layout

Figure 5-B Keypad Layout

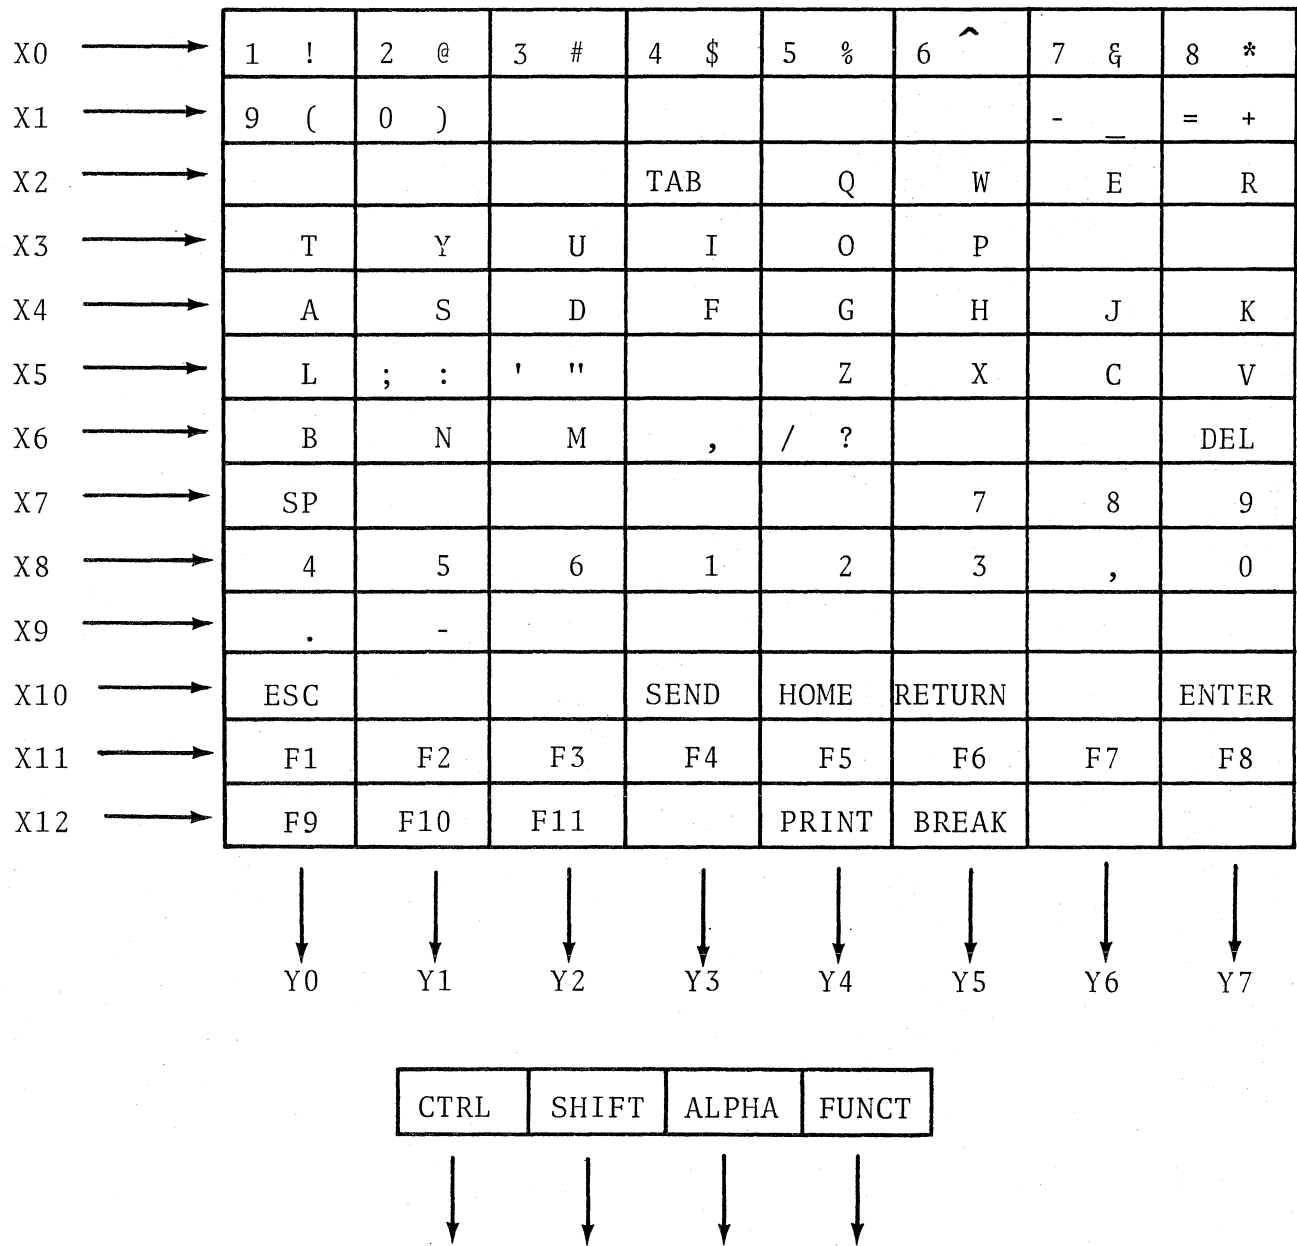

Figure 6 Keyboard X-Y Matrix Arrangement

4.9

Keyboard Interface

Communication between the main control board and the keyboard controller is asynchronous. The standard asynchronous format used by the 950 (Figure 9) consists of one start bit, eight data bits, and one stop bit. The baud rate is set to 1200 bits/sec.

Figure 7 Keyboard Interface

## 4.10

### Keyboard Scanning Method

The keyboard microprocessor (8048 or 8035) drives the scan lines (X lines), one at a time, to a low voltage. The return lines (Y lines) are tested by the microprocessor.

The keyboard matrix output ports (10 through 14, 20 through 27) latch the X0 through X12 lines to the keyboard. The connections are shown in Figure 7.

Whenever a low voltage is detected on a Y input line, it means that a key has been depressed. That key is at the intersection of the driven line (X) and the detected line (Y).

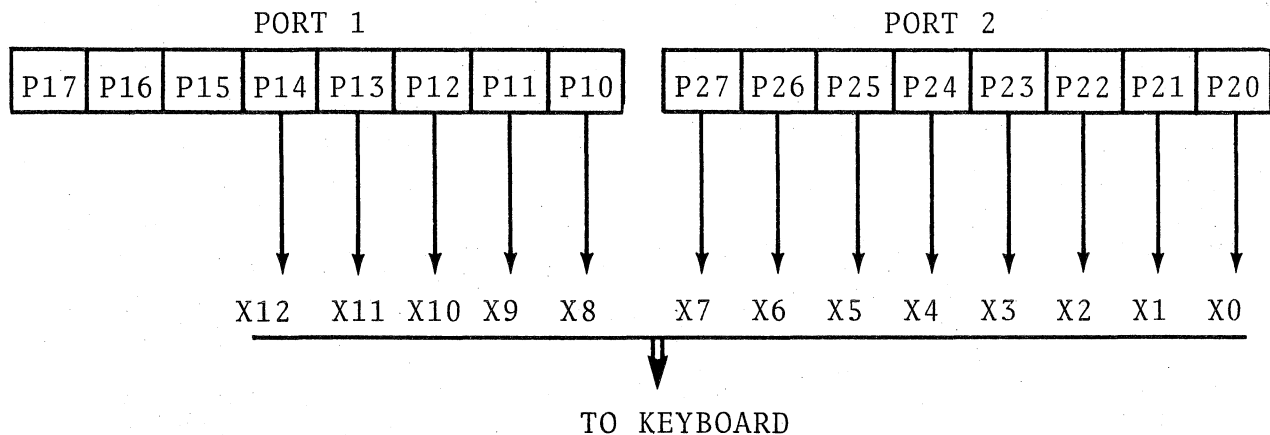

Figure 8 8048 Ports

The return matrix lines (Y lines) from the keyboard are read by the microprocessor's data bus (D0 through D7). The connections are shown in Figure 8.

Figure 9 8048 Data Bus

## Basic Scan Routine

Starting the scan routine resets the transmit flag and enables the external interrupt for receiving status from the control board.

The keyboard matrix is scanned from the top row to the bottom row. As soon as a key is pressed, the row is tested bit by bit, from left to right. The matrix key codes are immediately encoded and stored in two registers (NEWKY 1 and NEWKY 2).

If the results of a matrix scan indicate that more than two keys are depressed, the program enters a delay loop for 11 ms. Meanwhile, the whole matrix is read once again to verify that the key is still depressed. After the key is proven to be valid, the microprocessor sends the proper code to the terminal.

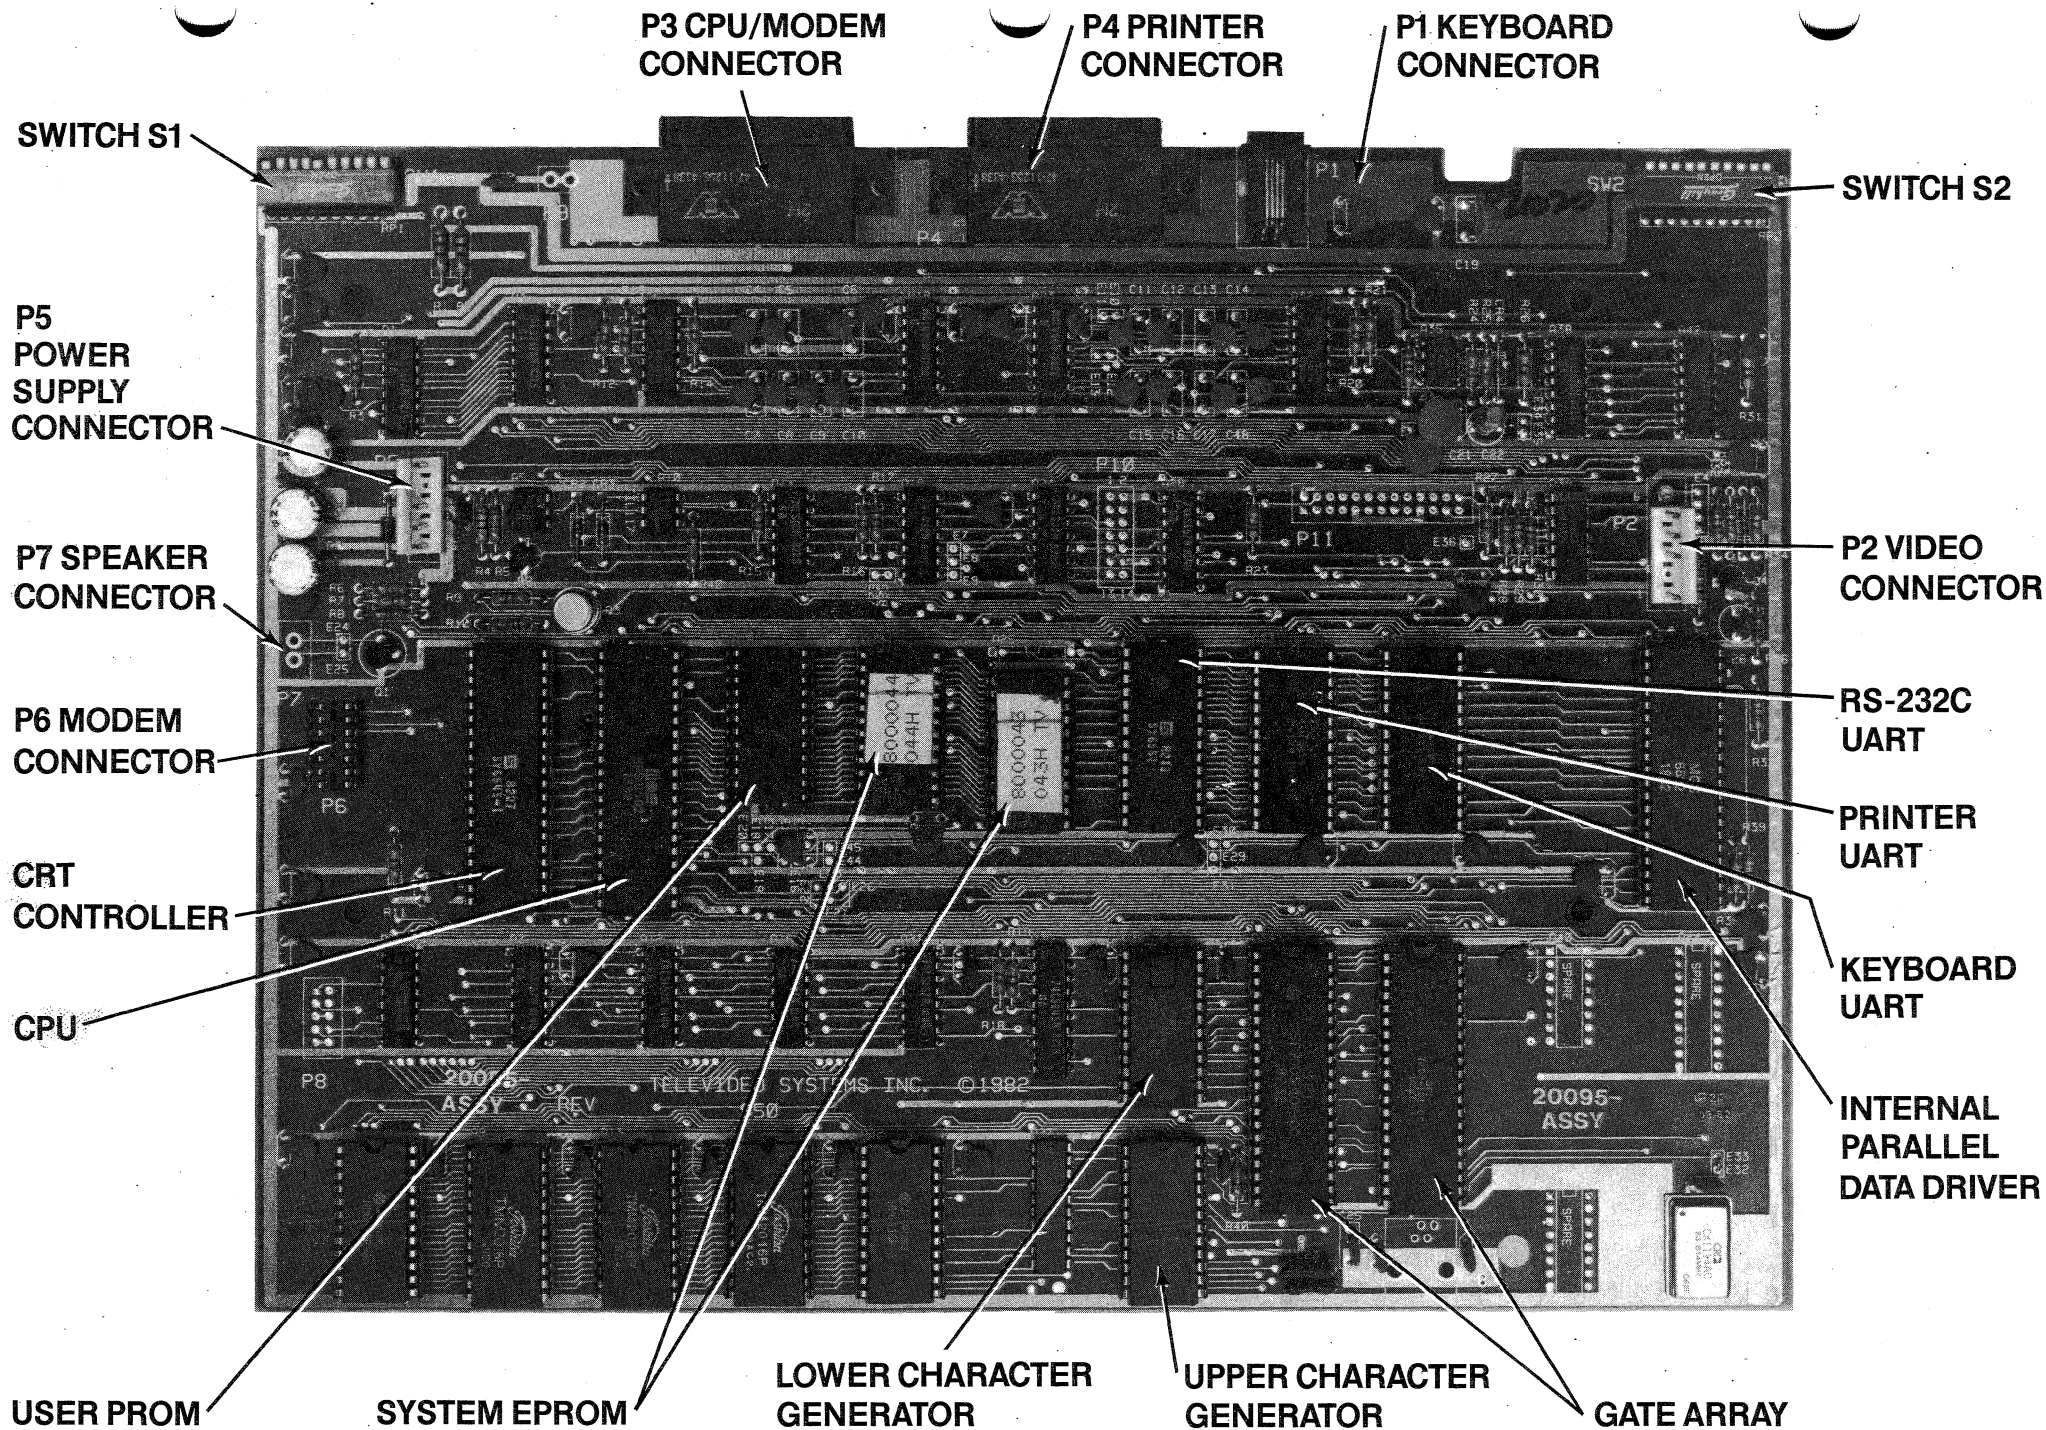

If the depressed key is a repeat key, the last portion of the scan routine controls the length of the repeat delay (0.5 sec.) and the autorepeat rate (16 char/sec.). The program then branches back to the beginning of the scan routine.

## 950 GATE ARRAY LOGIC BOARD

Newer model 950 terminals have a green gate array logic board instead of the blue TTL logic board found in older versions. The logic and control signals are the same on both boards. However, on the gate array board, the logic gates have been incorporated into one integral semi-custom IC, referred to as the gate array chip. This substantially reduces the number of chips on the logic board and makes it simpler to troubleshoot to the component and signal level.

The corresponding logic schematic in this manual for the 950 gate array board is labeled 950 G/A.

**Gate Array Board**

# R6500 Microcomputer System DATA SHEET

## R6500 MICROPROCESSORS (CPU's)

### SYSTEM ABSTRACT

The 8-bit R6500 microcomputer system is produced with N-Channel, Silicon Gate technology. Its performance speeds are enhanced by advanced system architecture. This innovative architecture results in smaller chips — the semiconductor threshold to cost-effectivity. System cost-effectivity is further enhanced by providing a family of 10 software-compatible microprocessor (CPU) devices, described in this document. Rockwell also provides memory and microcomputer system . . . as well as low-cost design aids and documentation.

### R6500 MICROPROCESSOR (CPU) CONCEPT

Ten CPU devices are available. All are software-compatible. They provide options of addressable memory, interrupt input, on-chip clock oscillators and drivers. All are bus-compatible with earlier generation microprocessors like the M6800 devices.

The family includes six microprocessors with on-board clock oscillators and drivers and four microprocessors driven by external clocks. The on-chip clock versions are aimed at high performance, low cost applications where single phase inputs, crystal or RC inputs provide the time base. The external clock versions are geared for multiprocessor system applications where maximum timing control is mandatory. All R6500 microprocessors are also available in a variety of packaging (ceramic and plastic), operating frequency (1 MHz and 2 MHz) and temperature (commercial, industrial and military) versions.

### MEMBERS OF THE R6500 MICROPROCESSOR (CPU) FAMILY

#### Microprocessors with On-Chip Clock Oscillator

Model	Addressable Memory
R6502	65K Bytes
R6503	4K Bytes
R6504	8K Bytes
R6505	4K Bytes
R6506	4K Bytes
R6507	8K Bytes

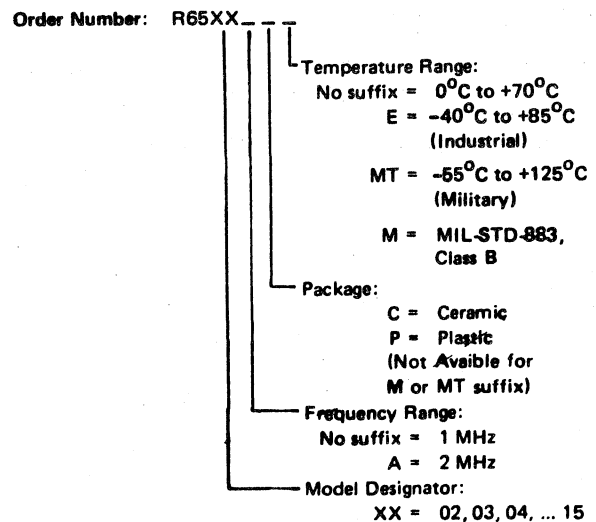

#### Microprocessors with External Two Phase Clock Output

Model	Addressable Memory
R6512	65K Bytes
R6513	4K Bytes
R6514	8K Bytes
R6515	4K Bytes

### FEATURES

- Single +5V supply
- N channel, silicon gate, depletion load technology
- Eight bit parallel processing
- 56 Instructions
- Decimal and binary arithmetic
- Thirteen addressing modes
- True indexing capability
- Programmable stack pointer
- Variable length stack
- Interrupt capability
- Non-maskable interrupt
- Use with any type of speed memory
- 8-bit Bidirectional Data Bus
- Addressable memory range of up to 65K bytes
- "Ready" input
- Direct Memory Access capability
- Bus compatible with M6800
- 1 MHz and 2 MHz operation
- Choice of external or on-chip clocks
- On-the-chip clock options
  - External single clock input
  - RC time base input
  - Crystal time base input
- Commercial, industrial and military temperature versions
- Pipeline architecture

### Ordering Information

**NOTE:** Contact your local Rockwell Representative concerning availability.

R6500 MICROPROCESSORS (CPU's)

## R6500 Signal Description

### Clocks ( $\phi_1$ , $\phi_2$ )

The R651X requires a two phase non-overlapping clock that runs at the  $V_{CC}$  voltage level.

The R650X clocks are supplied with an internal clock generator. The frequency of these clocks is externally controlled.

### Address Bus (A0-A15)

These outputs are TTL compatible, capable of driving one standard TTL load and 130 pF.

### Data Bus (D0-D7)

Eight pins are used for the data bus. This is a bidirectional bus, transferring data to and from the device and peripherals. The outputs are tri-state buffers capable of driving one standard TTL load and 130 pF.

### Data Bus Enable (DBE)

This TTL compatible input allows external control of the tri-state data output buffers and will enable the microprocessor bus driver when in the high state. In normal operation DBE would be driven by the phase two ( $\phi_2$ ) clock, thus allowing data output from microprocessor only during  $\phi_2$ . During the read cycle, the data bus drivers are internally disabled, becoming essentially an open circuit. To disable data bus drivers externally, DBE should be held low.

### Ready (RDY)

This input signal allows the user to halt or single cycle the microprocessor on all cycles except write cycles. A negative transition to the low state during or coincident with phase one ( $\phi_1$ ) will halt the microprocessor with the output address lines reflecting the current address being fetched. If Ready is low during a write cycle, it is ignored until the following read operation. This condition will remain through a subsequent phase two ( $\phi_2$ ) in which the Ready signal is low. This feature allows microprocessor interfacing with the low speed PROMs as well as fast (max. 2 cycle) Direct Memory Access (DMA).

### Interrupt Request ( $\overline{IRQ}$ )

This TTL level input requests that an interrupt sequence begin within the microprocessor. The microprocessor will complete the current instruction being executed before recognizing the request. At that time, the interrupt mask bit in the Status Code Register will be examined. If the interrupt mask flag is not set, the microprocessor will begin an interrupt sequence. The Program Counter and Processor Status Register are stored in the stack. The microprocessor will then set the interrupt mask flag high so that no further interrupts may occur. At the end of this cycle, the program counter low will be loaded from address FFFE, and program counter high from location FFFF, therefore transferring program control to the memory vector located at these addresses. The RDY signal must be in the high state for any interrupt to be recognized. A  $3K\Omega$  external resistor should be used for proper wire-OR operation.

### Non-Maskable Interrupt ( $\overline{NMI}$ )

A negative going edge on this input requests that a non-maskable interrupt sequence be generated within the microprocessor.

$\overline{NMI}$  is an unconditional interrupt. Following completion of the current instruction, the sequence of operations defined for  $\overline{IRQ}$  will be performed, regardless of the state interrupt mask flag. The vector address loaded into the program counter, low and high, are locations FFFA and FFFB respectively, thereby transferring program control to the memory vector located at these addresses. The instructions loaded at these locations cause the microprocessor to branch to a non-maskable interrupt routine in memory.

$\overline{NMI}$  also requires an external  $3K\Omega$  resistor to  $V_{CC}$  for proper wire-OR operations.

Inputs  $\overline{IRQ}$  and  $\overline{NMI}$  are hardware interrupt lines that are sampled during  $\phi_2$  (phase 2) and will begin the appropriate interrupt routine on the  $\phi_1$  (phase 1) following the completion of the current instruction.

### Set Overflow Flag (S.O.)

A negative going edge on this input sets the overflow bit in the Status Code Register. This signal is sampled on the trailing edge of  $\phi_1$  and must be externally synchronized.

### SYNC

This output line is provided to identify those cycles in which the microprocessor is doing an OP CODE fetch. The SYNC line goes high during  $\phi_1$  of an OP CODE fetch and stays high for the remainder of that cycle. If the RDY line is pulled low during the  $\phi_1$  clock pulse in which SYNC went high, the processor will stop in its current state and will remain in the state until the RDY line goes high. In this manner, the SYNC signal can be used to control RDY to cause single instruction execution.

### Reset

This input is used to reset or start the microprocessor from a power down condition. During the time that this line is held low, writing to or from the microprocessor is inhibited. When a positive edge is detected on the input, the microprocessor will immediately begin the reset sequence.

After a system initialization time of six clock cycles, the mask interrupt flag will be set and the microprocessor will load the program counter from the memory vector locations FFFC and FFFD. This is the start location for program control.

After  $V_{CC}$  reaches 4.75 volts in a power up routine, reset must be held low for at least two clock cycles. At this time the R/W and (SYNC) signal will become valid.

When the reset signal goes high following these two clock cycles, the microprocessor will proceed with the normal reset procedure detailed above.

## ADDRESSING MODES

**ACCUMULATOR ADDRESSING** — This form of addressing is represented with a one byte instruction, implying an operation on the accumulator.

**IMMEDIATE ADDRESSING** — In immediate addressing, the operand is contained in the second byte of the instruction, with no further memory addressing required.

**ABSOLUTE ADDRESSING** — In absolute addressing, the second byte of the instruction specifies the eight low order bits of the effective address while the third byte specifies the eight high order bits. Thus, the absolute addressing mode allows access to the entire 65K bytes of addressable memory.

**ZERO PAGE ADDRESSING** — The zero page instructions allow for shorter code and execution times by only fetching the second byte of the instruction and assuming a zero high address byte. Careful use of the zero page can result in significant increase in code efficiency.

**INDEXED ZERO PAGE ADDRESSING** — (X, Y indexing) — This form of addressing is used in conjunction with the index register and is referred to as "Zero Page, X" or "Zero Page, Y". The effective address is calculated by adding the second byte to the contents of the index register. Since this is a form of "Zero Page" addressing, the content of the second byte references a location in page zero. Additionally due to the "Zero Page" addressing nature of this mode, no carry is added to the high order 8 bits of memory and crossing of page boundaries does not occur.

**INDEXED ABSOLUTE ADDRESSING** — (X, Y indexing) — This form of addressing is used in conjunction with X and Y index register and is referred to as "Absolute, X", and "Absolute, Y". The effective address is formed by adding the contents of X or Y to the address contained in the second and third bytes of the instruction. This mode allows the index register to contain the index or count value and the instruction to contain the base address. This type of indexing allows any location referencing and the index to modify multiple fields resulting in reduced coding and execution time.

**IMPLIED ADDRESSING** — In the implied addressing mode, the address containing the operand is implicitly stated in the operation code of the instruction.

**RELATIVE ADDRESSING** — Relative addressing is used only with branch instructions and establishes a destination for the conditional branch.

The second byte of the instruction becomes the operand which is an "Offset" added to the contents of the lower eight bits of the program counter when the counter is set at the next instruction. The range of the offset is -128 to +127 bytes from the next instruction.

**INDEXED INDIRECT ADDRESSING** — In indexed indirect addressing (referred to as (Indirect, X)), the second byte of the instruction is added to the contents of the X index register, discarding the carry. The result of this addition points to a memory location on page zero whose contents is the low order eight bits of the effective address. The next memory location in page zero contains the high order eight bits of the effective address. Both memory locations specifying the high and low order bytes of the effective address must be in page zero.

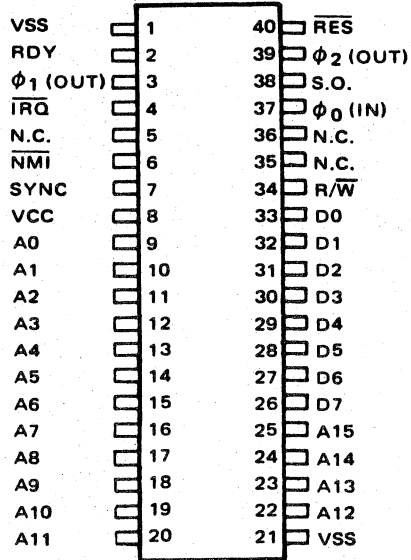

**INDIRECT INDEXED ADDRESSING** — In indirect indexed addressing (referred to as (Indirect, Y)), the second byte of the instruction points to a memory location in page zero. The contents of this memory location is added to the contents of the Y index register, the result being the low order eight bits of the effective address. The carry from this addition is added to the contents of the next page zero memory location, the result being the high order eight bits of the effective address.

**ABSOLUTE INDIRECT** — The second byte of the instruction contains the low order eight bits of a memory location. The high order eight bits of that memory location is contained in the third byte of the instruction. The contents of the fully specified memory location is the low order byte of the effective address. The next memory location contains the high order byte of the effective address which is loaded into the sixteen bits of the program counter.

## INSTRUCTION SET — ALPHABETIC SEQUENCE

ADC	Add Memory to Accumulator with Carry	JMP	Jump to New Location
AND	"AND" Memory with Accumulator	JSR	Jump to New Location Saving Return Address
ASL	Shift left One Bit (Memory or Accumulator)	LDA	Load Accumulator with Memory
BCC	Branch on Carry Clear	LDX	Load Index X with Memory
BCS	Branch on Carry Set	LDY	Load Index Y with Memory
BEQ	Branch on Result Zero	LSR	Shift One Bit Right (Memory or Accumulator)
BIT	Test Bits in Memory with Accumulator	NOP	No Operation
BMI	Branch on Result Minus	ORA	"OR" Memory with Accumulator
BNE	Branch on Result not Zero	PHA	Push Accumulator on Stack
BPL	Branch on Result Plus	PHP	Push Processor Status on Stack
BRK	Force Break	PLA	Pull Accumulator from Stack
BVC	Branch on Overflow Clear	PLP	Pull Processor Status from Stack
BVS	Branch on Overflow Set	ROL	Rotate One Bit Left (Memory or Accumulator)
CLC	Clear Carry Flag	ROR	Rotate One Bit Right (Memory or Accumulator)
CLD	Clear Decimal Mode	RTI	Return from Interrupt
CLI	Clear Interrupt Disable Bit	RTS	Return from Subroutine
CLV	Clear Overflow Flag	SBC	Subtract Memory from Accumulator with Borrow
CMP	Compare Memory and Accumulator	SEC	Set Carry Flag
CPX	Compare Memory and Index X	SED	Set Decimal Mode
CPY	Compare Memory and Index Y	SEI	Set Interrupt Disable Status
DEC	Decrement Memory by One	STA	Store Accumulator in Memory
DEX	Decrement Index X by One	STX	Store Index X in Memory
DEY	Decrement Index Y by One	STY	Store Index Y in Memory
EOR	"Exclusive-or" Memory with Accumulator	TAX	Transfer Accumulator to Index X
INC	Increment Memory by One	TAY	Transfer Accumulator to Index Y
INX	Increment Index X by One	TSX	Transfer Stack Pointer to Index X
INY	Increment Index Y by One	TXA	Transfer Index X to Accumulator
		TXS	Transfer Index X to Stack Register
		TYA	Transfer Index Y to Accumulator

### R6502 – 40 Pin Package

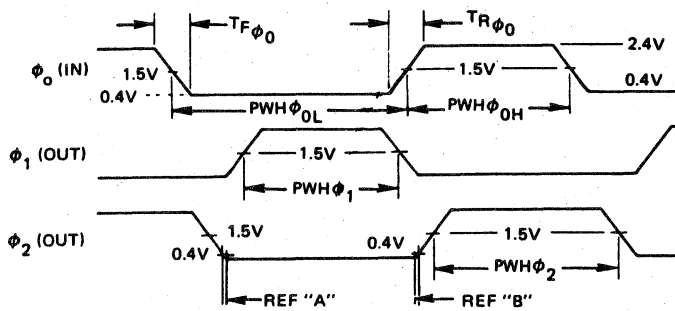

### Features of R6502

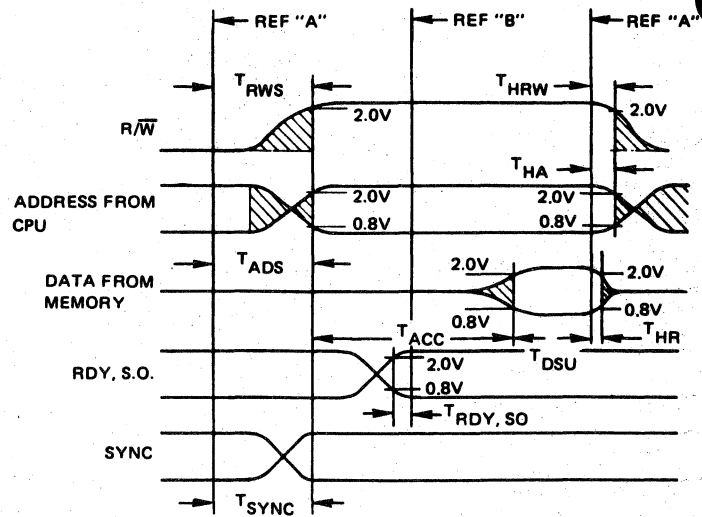

- 65K Addressable Bytes of Memory (A0-A15)
- $\overline{\text{IRQ}}$  Interrupt
- On-the-chip Clock
  - TTL Level Single Phase Input
  - RC Time Base Input
  - Crystal Time Base Input
- SYNC Signal  
(can be used for single instruction execution)
- RDY Signal  
(can be used to halt or single cycle execution)
- Two Phase Output Clock for Timing of Support Chips
- $\overline{\text{NMI}}$  Interrupt

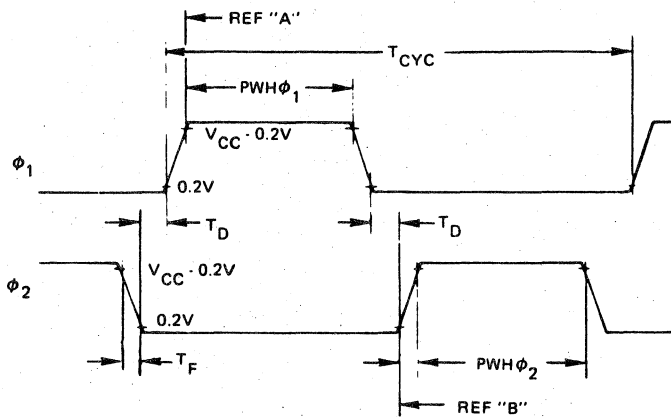

### Clock Timing – R6502, 03, 04, 05, 06, 07

### Timing for Reading Data from Memory or Peripherals

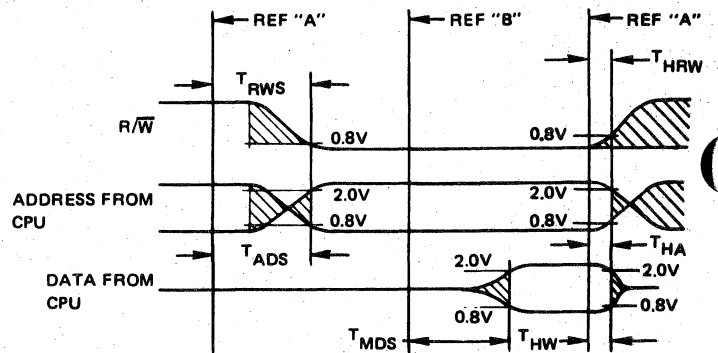

### Clock Timing – R6512, 13, 14, 15

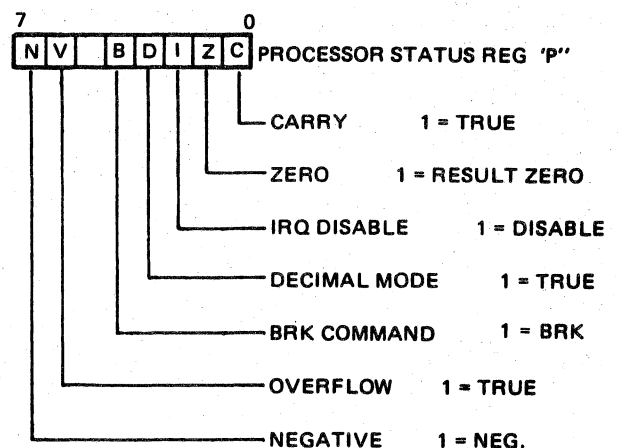

Note: "REF." means Reference Points on clocks.

### Timing for Writing Data to Memory or Peripherals

## PROGRAMMING MODEL

Note: 1. Clock Generator is not included on R6512, 13, 14, 15  
 2. Addressing Capability and control options vary with each of the R6500 Products.

**R6500 Internal Architecture**

# R6500 Microcomputer System DATA SHEET

## VERSATILE INTERFACE ADAPTER (VIA)

### SYSTEM ABSTRACT

The 8-bit R6500 microcomputer system is produced with N-channel, silicon-gate, depletion-load technology. Its performance speeds are enhanced by advanced system architecture. Its innovative architecture results in smaller chips — the semiconductor threshold to cost-effectivity. System cost-effectivity is further enhanced by providing a family of 10 software-compatible microprocessor (CPU) devices, memory and I/O devices . . . as well as low-cost design aids and documentation.

### DESCRIPTION

The R6522 VIA adds two powerful, flexible Interval Timers, a serial-to-parallel/parallel-to-serial shift register and input latching on the peripheral ports to the capabilities of the R6520 Peripheral Interface Adapter (PIA) device. Handshaking capability is expanded to allow control of bidirectional data transfers between VIAs in multiple processor systems and between peripherals.

Control of peripherals is primarily through two 8-bit bidirectional ports. Each of these ports can be programmed to act as an input or an output. Peripheral I/O lines can be selectively controlled by the Interval Timers to generate programmable-frequency square waves and/or to count externally generated pulses. Positive control of VIA functions is gained through its internal register organization: Interrupt Flag Register, Interrupt Enable Register, and two Function Control Registers.

### FEATURES

- Organized for simplified software control of many functions
- Compatible with the R650X and R651X family of microprocessors (CPUs)
- Bi-directional, 8-bit data bus for communication with microprocessor
- Two Bi-directional, 8-bit input/output ports for interface with peripheral devices
- CMOS and TTL compatible input/output peripheral ports
- Data Direction Registers allow each peripheral pin to act as either an input or an output
- Interrupt Flag Register allows the microprocessor to readily determine the source of an interrupt and provides convenient control of the interrupts within the chip
- Handshake control logic for input/output peripheral data transfer operations
- Data latching on peripheral input/output ports
- Two fully-programmable interval timers/counters
- Eight-bit Shift Register for serial interface
- Forty-pin plastic or ceramic DIP package.

### Ordering Information

Order Number	Package Type	Frequency	Temperature Range
R6522P	Plastic	1 MHz	0°C to +70°C
R6522AP	Plastic	2 MHz	0°C to +70°C
R6522C	Ceramic	1 MHz	0°C to +70°C
R6522AC	Ceramic	2 MHz	0°C to +70°C
R6522PE	Plastic	1 MHz	-40°C to +85°C
R6522APE	Plastic	2 MHz	-40°C to +85°C
R6522CE	Ceramic	1 MHz	-40°C to +85°C
R6522ACE	Ceramic	2 MHz	-40°C to +85°C
R6522CMT	Ceramic	1 MHz	-55°C to +125°C

## OPERATION SUMMARY

### Register Select Lines (RS0, RS1, RS2, RS3)

The four Register select lines are normally connected to the processor address bus lines to allow the processor to select the internal R6522 register which is to be accessed. The sixteen possible combinations access the registers as follows:

RS3	RS2	RS1	RS0	Register	Remarks	RS3	RS2	RS1	RS0	Register	Remarks
L	L	L	L	ORB	Controls Handshake	H	L	L	L	T2L-L	Write Latch Read Counter
L	L	L	H	ORA		H	L	L	H	T2C-L	
L	L	H	L	DDRBB		H	L	L	H	T2C-H	Triggers T2L-L/T2C-L Transfer
L	L	H	H	DDRA		H	L	H	H	SR	
L	H	L	L	T1L-L	Write Latch Read Counter	H	L	H	H	ACR	No Effect on Handshake
L	H	L	H	T1C-L		H	H	L	L	PCR	
L	H	L	H	T1C-H	Trigger T1L-L/T1C-L Transfer	H	H	L	H	IFR	
L	H	H	L	T1L-L		H	H	H	L	IER	
L	H	H	H	T1L-H	H	H	H	H	ORA		

Note: L = 0.4V DC, H = 2.4V DC.

### Timer 2 Control

RS3	RS2	RS1	RS0	R/W = L	R/W = H
H	L	L	L	Write T2L-L	Read T2C-L Clear Interrupt flag
H	L	L	H	Write T2C-H Transfer T2L-L to T2C-L Clear Interrupt flag	Read T2C-H

### Writing the Timer 1 Register

The operations which take place when writing to each of the four T1 addresses are as follows:

RS3	RS2	RS1	RS0	Operation (R/W = L)
L	H	L	L	Write into low order latch
L	H	L	H	Write into high order latch
L	H	H	L	Write into high order counter
L	H	H	H	Transfer low order latch into low order counter Reset T1 interrupt flag
X	H	H	L	Write low order latch
X	H	H	H	Write high order latch Reset T1 interrupt flag

### Reading the Timer 1 Registers

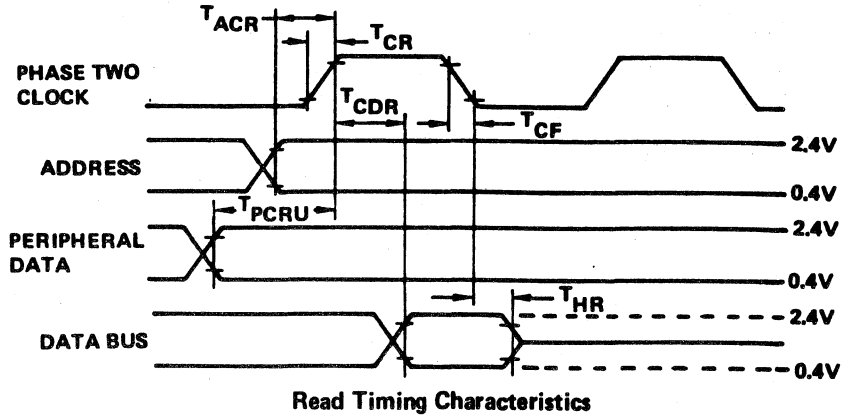

For reading the Timer 1 registers, the four addresses relate directly to the four registers as follows:

RS3	RS2	RS1	RS0	Operation (R/W = H)
L	H	L	L	Read T1 low order counter Reset T1 interrupt flag
L	H	L	H	Read T1 high order counter
L	H	H	L	Read T1 low order latch
L	H	H	H	Read T1 high order latch

# TIMING CHARACTERISTICS

## Read Timing Characteristics (loading 130 pF and one TTL load)

Parameter	Symbol	Min	Typ	Max	Unit
Delay time, address valid to clock positive transition	$T_{ACR}$	180	—	—	nS
Delay time, clock positive transition to data valid on bus	$T_{CDR}$	—	—	395	nS
Peripheral data setup time	$T_{PCR}$	300	—	—	nS
Data bus hold time	$T_{HR}$	10	—	—	nS
Rise and fall time for clock input	$T_{RC}$ $T_{RF}$	—	—	25	nS

Read Timing Characteristics

## Write Timing Characteristics

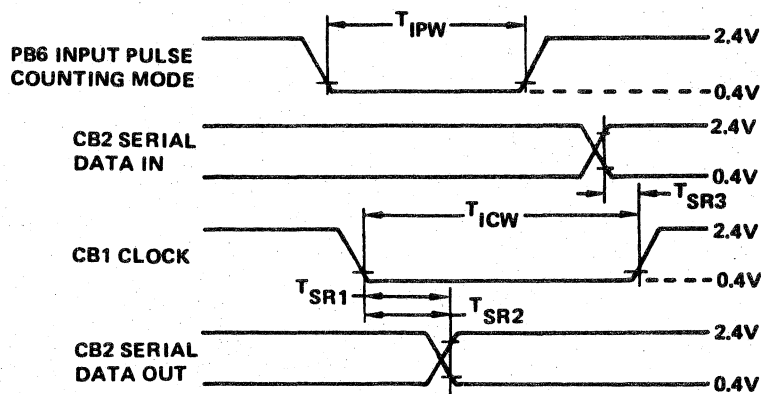

Parameter	Symbol	Min	Typ	Max	Unit
Enable pulse width	$T_C$	0.47	—	25	$\mu$ S
Delay time, address valid to clock positive transition	$T_{ACW}$	180	—	—	nS
Delay time, data valid to clock negative transition	$T_{DCW}$	300	—	—	nS
Delay time, read/write negative transition to clock positive transition	$T_{WCW}$	180	—	—	nS
Data bus hold time	$T_{HW}$	10	—	—	nS
Delay time, Enable negative transition to peripheral data valid	$T_{CPW}$	—	—	1.0	$\mu$ S
Delay time, clock negative transition to peripheral data valid CMOS ( $V_{CC} - 30\%$ )	$T_{CMOS}$	—	—	2.0	$\mu$ S

Write Timing Characteristics

### I/O Timing Characteristics

Characteristic	Symbol	Min	Typ	Max	Unit
Rise and fall time for CA1, CB1, CA2 and CB2 input signals	$T_{RF}$	—	—	1.0	$\mu\text{s}$
Delay time, clock negative transition to CA2 negative transition (read handshake or pulse mode)	$T_{CA2}$	—	—	1.0	$\mu\text{s}$
Delay time, clock negative transition to CA2 positive transition (pulse mode)	$T_{RS1}$	—	—	1.0	$\mu\text{s}$
Delay time, CA1 active transition to CA2 positive transition (handshake mode)	$T_{RS2}$	—	—	2.0	$\mu\text{s}$
Delay time, clock positive transition to CA2 or CB2 negative transition (write handshake)	$T_{WHS}$	—	—	1.0	$\mu\text{s}$
Delay time, peripheral data valid to CB2 negative transition	$T_{DC}$	0	—	1.5	$\mu\text{s}$
Delay time, clock positive transition to CA2 or CB2 positive transition (pulse mode)	$T_{RS3}$	—	—	1.0	$\mu\text{s}$
Delay time, CB1 active transition to CA2 or CB2 positive transition (handshake mode)	$T_{RS4}$	—	—	2.0	$\mu\text{s}$
Delay time, peripheral data valid to CA1 or CB1 active transition (input latching)	$T_{IL}$	300	—	—	ns
Delay time CB1 negative transition to CB2 data valid (internal SR clock, shift out)	$T_{SR1}$	—	—	300	ns
Delay time, negative transition of CB1 input clock to CB2 data valid (external clock, shift out)	$T_{SR2}$	—	—	300	ns
Delay time, CB2 data valid to positive transition of CB1 clock (shift in, internal or external clock)	$T_{SR3}$	—	—	300	ns
Pulse Width — PB6 Input Pulse	$T_{IPW}$	2	—	—	$\mu\text{s}$
Pulse Width — CB1 Input Clock	$T_{ICW}$	2	—	—	$\mu\text{s}$
Pulse Spacing — PB6 Input Pulse	$I_{IPS}$	2	—	—	$\mu\text{s}$
Pulse Spacing — CB1 Input Pulse	$I_{ICS}$	2	—	—	$\mu\text{s}$

I/O Timing Characteristics

### Timer 1 Operating Modes

Two bits are provided in the Auxiliary Control Register to allow selection of the T1 operating modes. These bits and the four possible modes are as follows:

ACR7 Output Enable	ACR6 "Free-Run" Enable	Mode
0	0	Generate a single time-out interrupt each time T1 is loaded
0	1	Generate continuous interrupts
1	0	Generate a single interrupt and an output pulse on PB7 for each T1 load operation
1	1	Generate continuous interrupts and a square wave output on PB7

### FUNCTION CONTROL

Control of the various functions and operating modes within the R6522 is accomplished primarily through two registers, the Peripheral Control Register (PCR), and the Auxiliary Control Register (ACR). The PCR is used primarily to select the operating mode for the four peripheral control pins. The Auxiliary Control Register selects the operating mode for the Interval Timers (T1, T2), and the Serial Port (SR).

#### Peripheral Control Register

The Peripheral Control Register is organized as follows:

Bit #	7	6	5	4	3	2	1	0
Function	CB2 Control			CB1 Control	CA2 Control			CA1 Control

Typical functions are shown below:

PCR3	PCR2	PCR1	Mode
0	0	0	Input mode – Set CA2 interrupt flag (IFR0) on a negative transition of the input signal. Clear IFR0 on a read or write of the Peripheral A Output Register.
0	0	1	Independent interrupt input mode – Set IFR0 on a negative transition of the CA2 input signal. Reading or writing ORA does not clear the CA2 interrupt flag.
0	1	0	Input mode – Set CA2 interrupt flag on a positive transition of the CA2 input signal. Clear IFR0 with a read or write of the Peripheral A Output Register.
0	1	1	Independent interrupt input mode – Set IFR0 on a positive transition of the CA2 input signal. Reading or writing ORA does not clear the CA2 interrupt flag.
1	0	0	Handshake output mode – Set CA2 output low on a read or write of the Peripheral A Output Register. Reset CA2 high with an active transition on CA1.
1	0	1	Pulse output mode – CA2 goes low for one cycle following a read or write of the Peripheral A Output Register.
1	1	0	Manual output mode – The CA2 output is held low in this mode.
1	1	1	Manual output mode – The CA2 output is held high in this mode.

### Auxiliary Control Register

Many of the functions in the Auxiliary Control Register have been discussed previously. However, a summary of this register is presented here as a convenient reference for the R6522 user. The Auxiliary Control Register is organized as follows:

Bit #	7	6	5	4	3	2	1	0
Function	T1 Control		T2 Control	Shift Register Control			PB Latch Enable	PA Latch Enable

### Shift Register Control

The Shift Register operating mode is selected as follows:

ACR4	ACR3	ACR2	Mode
0	0	0	Shift Register Disabled.
0	0	1	Shift in under control of Timer 2.
0	1	0	Shift in under control of system clock.
0	1	1	Shift in under control of external clock pulses.
1	0	0	Free-running output at rate determined by Timer 2.
1	0	1	Shift out under control of Timer 2.
1	1	0	Shift out under control of the system clock.
1	1	1	Shift out under control of external clock pulses.

### T2 Control

Timer 2 operates in two modes. If ACR5 = 0, T2 acts as an interval timer in the one-shot mode. If ACR5 = 1, Timer 2 acts to count a pre-determined number of pulses on pin PB6.

# R6500 Microcomputer System DATA SHEET

## CRT CONTROLLER (CRTC)

### DESCRIPTION

The R6545-1 CRT Controller (CRTC) is designed to interface an 8-bit microprocessor to CRT raster scan video displays, and adds an advanced CRT controller to the established and expanding line of R6500 products.

The R6545-1 provides refresh memory addresses and character generator row addresses which allow up to 16K characters with 32 scan lines per character to be addressed. A major advantage of the R6545-1 is that the refresh memory may be addressed in either straight binary or by row/column.

Other functions in the R6545-1 include an internal cursor register which generates a cursor output when its contents are equal to the current refresh address. Programmable cursor start and end registers allow a cursor of up to the full character scan in height to be placed on any scan lines of the character. Variable cursor display blink rates are provided. A light pen strobe input allows capture of the current refresh address in an internal light pen register. The refresh address lines are configured to provide direct dynamic memory refresh.

All timing for the video refresh memory signals is derived from the character clock input. Shift register, latch, and multiplex control signals (when needed) are provided by external high-speed timing. The mode control register allows non-interfaced video display modes at 50 or 60 Hz refresh rate. The internal status register may be used to monitor the R6545-1 operation. The  $\overline{RES}$  input allows the CRTC-generated field rate to be dynamically-synchronized with line frequency jitter.

### FEATURES

- Compatible with 8-bit microprocessors
- Up to 2.5 MHz character clock operation
- Refresh RAM may be configured in row/column or straight binary addressing
- Alphanumeric and limited graphics capability
- Up and down scrolling by page, line, or character
- Programmable Vertical Sync Width
- Fully programmable display (rows, columns, character matrix)
- Non-interfaced scan
- 50/60 Hz operation
- Fully programmable cursor
- Light pen register
- Addresses refresh RAM to 16K characters
- No external DMA required
- Internal status register
- 40-Pin ceramic or plastic DIP
- Pin-compatible with MC6845
- Single +5  $\pm$ 5% Volt Power Supply

### ORDERING INFORMATION

Part Number	Package Type	Frequency	Temperature Range
R6545-1P	Plastic	1 MHz	0°C to +70°C
R6545-1AP	Plastic	2 MHz	0°C to +70°C
R6545-1C	Ceramic	1 MHz	0°C to +70°C
R6545-1AC	Ceramic	2 MHz	0°C to +70°C

R6545-1 Pin Configuration

CRT CONTROLLER (CRTC)

## INTERFACE SIGNAL DESCRIPTION

### CPU INTERFACE

#### $\phi 2$ (Phase 2 Clock)

The input clock is the system Phase 2 ( $\phi 2$ ) clock and is used to trigger all data transfers between the system processor (CPU) and the R6545-1. Since there is no maximum limit to the allowable  $\phi 2$  clock time, it is not necessary for it to be a continuous clock. This capability permits the R6545-1 to be easily interfaced to non-6500 compatible microprocessors.

#### R/ $\bar{W}$ (Read/Write)

The R/ $\bar{W}$  input signal generated by the processor is used to control the direction of data transfers. A high on the R/ $\bar{W}$  pin allows the processor to read the data supplied by the R6545-1, a low on the R/ $\bar{W}$  pin allows data on data lines D0-D7 to be written into the R6545-1.

#### $\bar{CS}$ (Chip Select)

The Chip Select input is normally connected to the processor address bus either directly or through a decoder. The R6545-1 is selected when  $\bar{CS}$  is low.

#### RS (Register Select)

The Register Select input is used to access internal registers. A low on this pin permits writes (R/ $\bar{W}$  = low) into the Address Register and reads (R/ $\bar{W}$  = high) from the Status Register. The contents of the Address Register is the identity of the register accessed when RS is high.

#### D0-D7 (Data Bus)

D0-D7 are the eight data lines used to transfer data between the processor and the R6545-1. These lines are bidirectional and are normally high-impedance except during read cycles when the chip is selected ( $\bar{CS}$  = low).

### VIDEO INTERFACE

#### HSYNC (Horizontal Sync)

The HSYNC signal is an active-high output used to determine the horizontal position of displayed text. It may drive a CRT monitor directly or may be used for composite video generation. HSYNC time position and width are fully programmable.

#### VSNC (Vertical Sync)

The VSYNC signal is an active high output used to determine the vertical position of displayed text. Like HSYNC, VSYNC may be used to drive a CRT monitor or composite video generation circuits. VSYNC time position and width are both programmable.

#### DISPLAY ENABLE (Display Enable)

The DISPLAY ENABLE signal is an active-high output used to indicate when the R6545-1 is generating active display information. The number of horizontal display characters per row and the number of vertical display rows are both fully programmable and together are used to generate the DISPLAY ENABLE signal. DISPLAY ENABLE can be delayed one character time by setting bit 4 of R8 equal to 1.

### CURSOR (Cursor Coincidence)

The CURSOR signal is an active-high output used to indicate when the scan coincides with the programmed cursor position. The cursor position may be programmed to be any character in the address field. Furthermore, within the character, the cursor may be programmed to be any block of scan lines, since the start scan line and the end scan line are both programmable. The cursor position may be delayed by one character time by setting Bit 5 of R8 to a "1".

### LPEN (Light Pen Strobe)

The LPEN signal is an edge-sensitive input used to load the internal Light Pen Register with the contents of the Refresh Scan Counter at the time the active edge occurs. The active edge of LPEN is the low-to-high transition.

### CCLK (Clock)

The CCLK signal is the character timing clock input and is used as the time base for all internal count/control functions.

### $\bar{RES}$

The  $\bar{RES}$  signal is an active-low input used to initialize all internal scan counter circuits. When  $\bar{RES}$  is low, all internal counters are stopped and cleared, all scan and video outputs are low, and control registers are unaffected.  $\bar{RES}$  must stay low for at least one CCLK period. All scan timing is initiated when  $\bar{RES}$  goes high. In this way,  $\bar{RES}$  can be used to synchronize display frame timing with line frequency.  $\bar{RES}$  may also be used to synchronize multiple CRTCs in horizontal and/or vertical split screen operation.

### REFRESH RAM AND CHARACTER ROM INTERFACE

#### MA0-MA13 (Refresh RAM Address Lines)

These 14 signals are active-high outputs used to address the Refresh RAM for character storage and display operations. The starting scan address is fully programmable and the ending scan address is determined by the total number of characters displayed, which is also programmable, in terms of characters/line and lines/frame.

There are two selectable address modes for MA0-MA13:

In the straight binary mode (R8, Mode Control, bit 2 = "0"), characters are stored in successive memory locations. Thus, the software must be designed such that row and column character coordinates are translated into sequentially-numbered addresses. In the row/column mode (R8, Mode Control, bit 2 = "1"), MA0-MA7 become column addresses CC0-CC7 and MA8-MA13 become row addresses CR0-CR5. In this case, the software can manipulate characters in terms of row and column locations, but additional address compression circuits are needed to convert the CC0-CC7 and CR0-CR5 addresses into a memory-efficient binary address scheme.

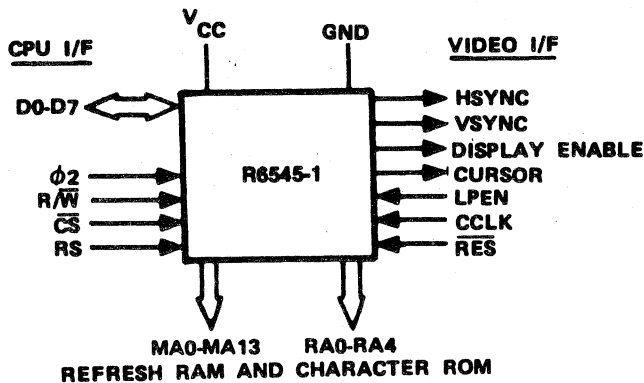

#### RA0-RA4 (Raster Address Lines)

These 5 signals are active-high outputs used to select each raster scan within an individual character row. The number of raster scan lines is programmable and determines the character height, including spaces between character rows.

# INTERNAL REGISTER ORGANIZATION

$\overline{CS}$	RS	Address Register					Reg. No.	Register Name	Register Units	Read (R/W = High)	Write (R/W = Low)	Register Bit

Table 1. Overall Register Structure and Addressing

R6545-1 Interface Diagram

## INTERNAL REGISTER DESCRIPTION

### ADDRESS REGISTER

This 5-bit write-only register is used as a "pointer" to direct CRTC/CPU data transfers within the CRTC. Its contents is the number of the desired register (0-17). When  $\overline{CS}$  and RS are low, then this register may be loaded; when  $\overline{CS}$  is low and RS is high, then the register selected is the one whose identity is stored in this address register.

### STATUS REGISTER (SR)

This 8-bit register contains the status of the CRTC. Only two bits are assigned, as follows:

- Vertical Re-Traces (VRT)**  
 0 = Scan is not currently in its vertical re-trace time.  
 1 = Scan is currently in its vertical re-trace time.  
 Note that this bit actually goes to a "1" when vertical re-trace starts, but goes to a "0" five character clock times before vertical re-trace ends, so that critical timings for refresh RAM operations are avoided.
- LPEN Register Full (LRF)**  
 0 = Register R16 or R17 has been read by the CPU.  
 1 = LPEN strobe has been received.
- SR6, SR4, SR3, SR2, SR1, SR0: NOT USED

NOTE: The Status Register takes the State, 

-	0	1	-	-	-	-	-
---	---	---	---	---	---	---	---

 immediately after power ( $V_{CC}$ ) turn-on.

### R0—HORIZONTAL TOTAL CHARACTERS

This 8-bit write-only register contains the total of displayed and non-displayed characters, minus one, per horizontal line. The frequency of HSYNC is thus determined by this register.

### R1—HORIZONTAL DISPLAYED CHARACTERS

This 8-bit write-only register contains the number of displayed characters per horizontal line.

### R2—HORIZONTAL SYNC POSITION

This 8-bit write-only register contains the position of the horizontal SYNC on the horizontal line, in terms of the character location number on the line. The position of the HSYNC determines the left to right location of the displayed text on the video screen. In this way, the side margins are adjusted.

### R3—HORIZONTAL AND VERTICAL SYNC WIDTHS

This 8-bit write-only register contains the widths of both HSYNC and VSYNC, as follows:

Control of these parameters allows the R6545-1 to be interfaced to a variety of CRT monitors, since the HSYNC and VSYNC timing signals may be accommodated without the use of external one shot timing.

### R4—VERTICAL TOTAL ROWS

The Vertical Total Register is a 7-bit register containing the total number of character rows in a frame, minus one. This register, along with R5, determines the overall frame rate, which should be close to the line frequency to ensure flicker-free appearance. If the frame time is adjusted to be longer than the period of the line frequency, then  $\overline{RES}$  may be used to provide absolute synchronism.

### R5—VERTICAL TOTAL LINE ADJUST

The Vertical Total Line Adjust Register (R5) is a 5-bit write-only register containing the number of additional scan lines needed to complete an entire frame scan and is intended as a fine adjustment for the video frame time.

### R6—VERTICAL DISPLAYED ROWS

This 7-bit write-only register contains the number of displayed character rows in each frame.

### R7—VERTICAL SYNC POSITION

This 7-bit write-only register is used to select the character row time at which the vertical SYNC pulse is desired to occur and, thus, is used to position the displayed text in the vertical direction.

### R8—MODE CONTROL (MC)

This 8-bit write-only register selects the operating modes of the R6545-1, as follows:

### R9—ROW SCAN LINES

This 5-bit write-only register contains the number of scan lines, minus one, per character row, including spacing.

### R10—CURSOR START LINE

### R11—CURSOR END LINE

These 5-bit write-only registers select the starting and ending scan lines for the cursor. In addition, bits 5 and 6 of R10 are used to select the cursor blink mode, as follows:

Bit	Bit	Cursor Blink Mode
6	5	
0	0	Display Cursor Continuously
0	1	Blank Cursor Continuously
1	0	Blink Cursor at 1/16 Field Rate
1	1	Blink Cursor at 1/32 Field Rate

### R12—DISPLAY START ADDRESS HIGH

### R13—DISPLAY START ADDRESS LOW

These registers form a 14-bit register whose contents is the memory address of the first character of the displayed scan (the character on the top left of the video display, as in Figure 1). Subsequent memory addresses are generated by the R6545-1 as a result of CCLK input pulses. Scrolling of the display is accomplished by changing R12 and R13 to the memory address associated with the first character of the desired line of text to be displayed first. Entire pages of text may be scrolled or changed as well via R12 and R13.

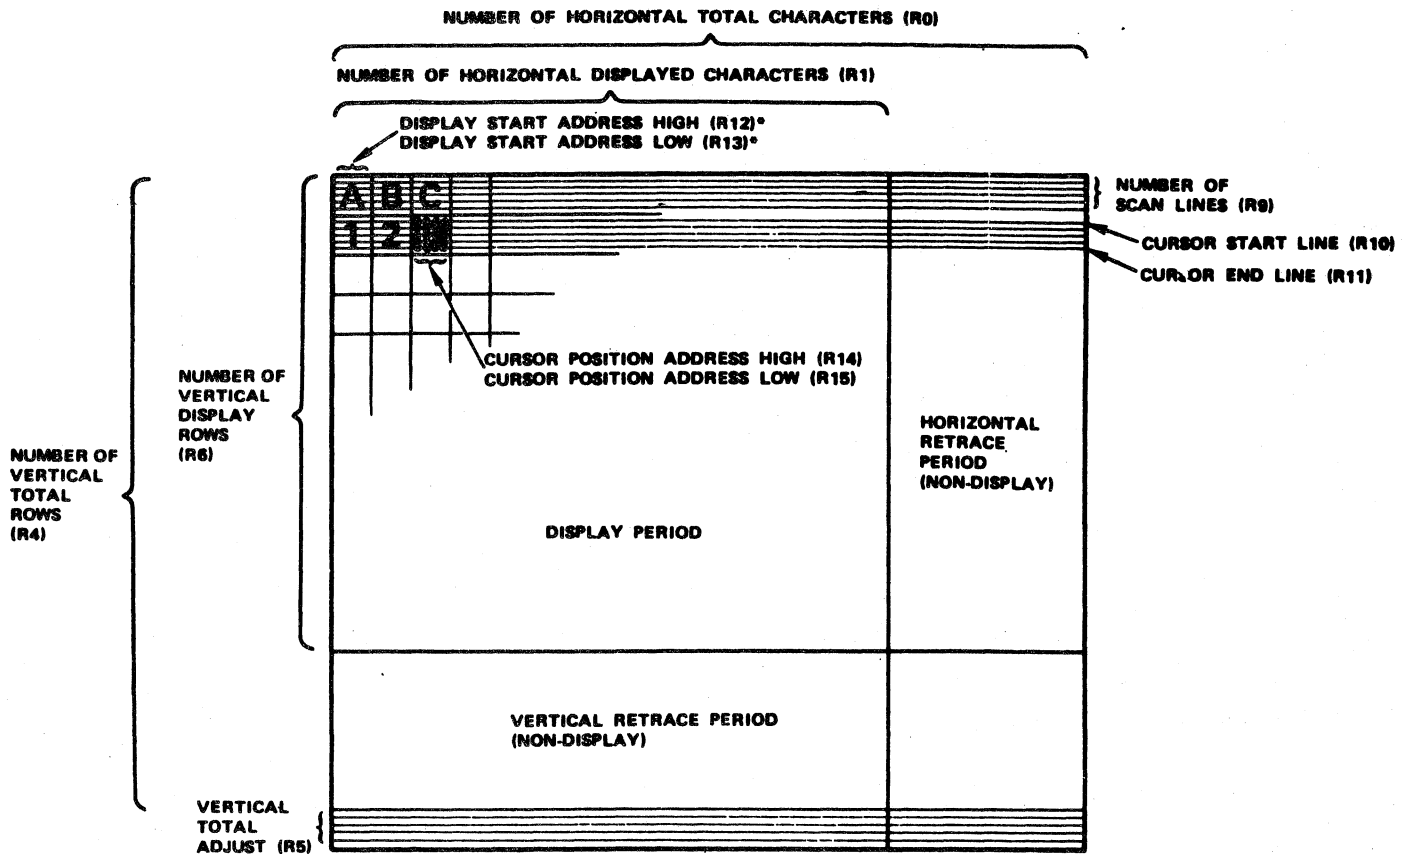

Figure 1. Video Display Format

**R14—CURSOR POSITION HIGH**  
**R15—CURSOR POSITION LOW**

These registers form a 14-bit register whose contents is the memory address of the current cursor position. When the video display scan counter (MA lines) matches the contents of this register, and when the scan line counter (RA lines) falls within the bounds set by R10 and R11, then the CURSOR output becomes active. Bit 5 of the Mode Control Register (R8) may be used to delay the CURSOR output by a full CCLK time to accommodate slow access memories.

**R16—LIGHT PEN HIGH**  
**R17—LIGHT PEN LOW**

These registers form a 14-bit register whose contents is the light pen strobe position, in terms of the video display address at which the strobe occurred. When the LPEN input changes from low to high, then, on the next negative-going edge of CCLK, the contents of the internal scan counter is stored in registers R16 and R17.

#### REGISTER FORMATS

Register pairs R12/R13, R14/R15, and R16/R17 are formatted in one of two ways:

- (1) Straight binary, if register R8, bit 2 = "0".
- (2) Row/Column, if register R8, bit 2 = "1". In this case the low byte is the Character Column and the high byte is the Character Row.

## DESCRIPTION OF OPERATION

### VIDEO DISPLAY

Figure 1 indicates the relationship of the various program registers in the R6545-1 and the resultant video display.

Non-displayed areas of the Video Display are used for horizontal and vertical retrace functions of the CRT monitor. The horizontal and vertical sync signals, HSYNC and VSYNC, are programmed to occur during these intervals and are used to trigger the retrace in the CRT monitor. The pulse widths are constrained by the monitor requirements. The time position of the pulses may be adjusted to vary the display margins (left, right, top, and bottom).

### REFRESH RAM ADDRESSING

#### Shared Memory Mode (R8, bit 3 = "0")

In this mode, the Refresh RAM address lines (MA0-MA13) directly reflect the contents of the internal refresh scan character counter. Multiplex control, to permit addressing and selection of the RAM by both the CPU and the CRTIC, must be provided external to the CRTIC. In the Row/Column address mode, lines MA0-MA7 become character column addresses (CC0-CC7) and MA8-MA13 become character row addresses (CR0-CR5).

## ADDRESSING MODES

### Row/Column

In this mode, the CRTC address lines (MA0-MA13) are generated as 8 column (MA0-MA7) and 6 row (MA8-MA13) addresses. Extra hardware is needed to compress this addressing into a straight binary sequence in order to conserve memory in the refresh RAM.

### Binary

In this mode, the CRTC address lines are straight binary and no compression circuits are needed. However, software complexity is increased since the CRT characters cannot be stored in terms of their row and column locations, but must be sequential.

### USE OF DYNAMIC RAM FOR REFRESH MEMORY

The R6545-1 permits the use of dynamic RAMS as storage devices for the Refresh RAM by continuing to increment memory addresses in the non-display intervals of the scan. This is a viable technique, since the Display Enable signal controls the actual video display blanking. Figure 2 illustrates Refresh RAM addressing for the case of binary addressing for 80 columns and 24 rows with 10 non-displayed columns and 10 non-displayed rows.

TOTAL = 90											
DISPLAY = 80											
TOTAL = 34											
DISPLAY = 24											
0	1	2	3	76	77	78	79	80	81		89
80	81	82	83	156	157	158	159	160	161		169

2640	2641	2642				2717	2718	2720			2729

Figure 2. Memory Addressing Example (80 x 24)

### CURSOR OPERATION

A one character wide cursor can be controlled by storing values into the Cursor Start Line (R10) and Cursor End Line (R11) registers and into the Cursor Position Address High (R14) and Cursor Position Low (R15) registers.

Bits 5 and 6 in the Cursor Start Line High Register (R10) control the cursor display and blink rate as follows:

Bit 6	Bit 5	Cursor Operating Mode
0	0	Display Cursor Continuously
0	1	Blank Cursor Continuously
1	0	Blink Cursor at 1/16 Field Rate
1	1	Blink Cursor at 1/32 Field Rate

The cursor of up to 32 characters in height can be displayed on and between the scan lines as loaded into the Cursor Start Line (R10) and Cursor End Line (R11) Registers.

The cursor is positioned on the screen by loading the Cursor Position Address High (R14) and Cursor Position Address Low (R15) registers with the desired refresh RAM address. The cursor can be positioned in any of the 16K character positions. Hardware paging and data scrolling is thus allowed without loss of cursor position. Figure 3 is an example of the display cursor scan line.

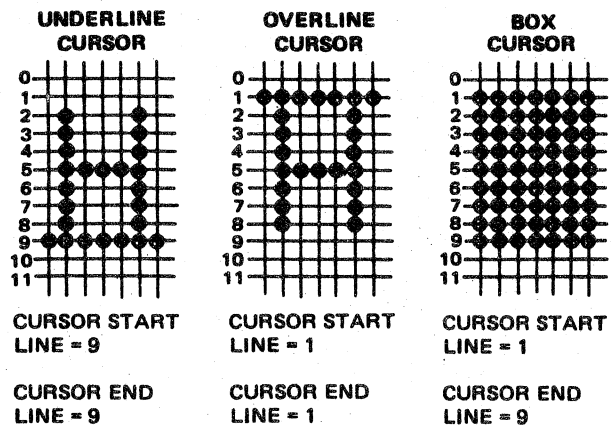

Figure 3. Cursor Display Scan Line Control Examples

## MPU WRITE TIMING CHARACTERISTICS

( $V_{CC} = 5.0V \pm 5\%$ ,  $T_A = 0$  to  $70^{\circ}C$ , unless otherwise noted)

Characteristic	Symbol	1 MHz		2 MHz		Unit
		Min	Max	Min	Max	
Cycle Time	$T_{CYC}$	1.0	—	0.5	—	$\mu s$
$\phi 2$ Pulse Width	$T_C$	440	—	200	—	ns
Address Set-Up Time	$T_{ACW}$	180	—	90	—	ns
Address Hold Time	$T_{CAH}$	0	—	0	—	ns
$R/\bar{W}$ Set-Up Time	$T_{WCW}$	180	—	90	—	ns
$R/\bar{W}$ Hold Time	$T_{CWH}$	0	—	0	—	ns

Cursor Propagation Delay	$T_{CDD}$	-	450	-	450	ns
LPEN Strobe Width	$T_{LPH}$	150	-	150	-	ns
LPEN to CCLK Delay	$T_{LP1}$	20	-	20	-	ns
CCLK to LPEN Delay	$T_{LP2}$	0	-	0	-	ns

$t_r, t_f = 20$  ns (max)

# SPECIFICATIONS

## Maximum Ratings

Rating	Symbol	Value	Unit
Supply Voltage	$V_{CC}$	-0.3 to +7.0	Vdc
Input Voltage	$V_{IN}$	-0.3 to +7.0	Vdc
Operating Temperature Range	$T_{OP}$	0 to +70	°C
Storage Temperature	$T_{STG}$	-55 to 150	°C

All inputs contain protection circuitry to prevent damage due to high static discharges. Care should be taken to prevent unnecessary application of voltages in excess of the allowable limits.

## Electrical Characteristics

( $V_{CC} = 5.0V \pm 5\%$ ,  $T_A = 0-70^\circ C$ , unless otherwise noted)

Characteristic	Symbol	Min	Max	Unit
Input High Voltage	$V_{IH}$	2.0	$V_{CC}$	Vdc
Input Low Voltage	$V_{IL}$	0.3	0.8	Vdc
Input Leakage ( $\overline{\theta 2}$ , $R/\overline{W}$ , $\overline{RES}$ , $\overline{CS}$ , $RS$ , $LPEN$ , $CCLK$ )	$I_{IN}$	-	2.5	$\mu A_{dc}$
Three-State Input Leakage (D0-D7) ( $V_{IN} = 0.4$ to $2.4V$ )	$I_{TSI}$	-	10.0	$\mu A_{dc}$
Output High Voltage $I_{LOAD} = 205 \mu A_{dc}$ (D0-D7) $I_{LOAD} = 100 \mu A_{dc}$ (all others)	$V_{OH}$	2.4	-	Vdc
Output Low Voltage $I_{LOAD} = 1.6 mA_{dc}$	$V_{OL}$	-	0.4	Vdc
Power Dissipation	$P_D$	-	1000	mW
Input Capacitance $\overline{\theta 2}$ , $R/\overline{W}$ , $\overline{RES}$ , $\overline{CS}$ , $RS$ , $LPEN$ , $CCLK$	$C_{IN}$	-	10.0	pF
D0-D7		-	12.5	pF
Output Capacitance	$C_{OUT}$	-	10.0	pF

# R6500 Microcomputer System DATA SHEET

## Asynchronous Communication Interface Adapter (ACIA)

The R6551 Asynchronous Communication Interface Adapter (ACIA) provides a program-controlled interface between 8-bit microprocessor-based systems and serial communication data sets and modems.

With its on-chip baud rate generator, the R6551 is capable of transmitting at 15 different program-selectable rates between 50 baud and 19,200 baud, and receiving at either the transmit rate or at 16 times an external clock rate. The R6551 has programmable word lengths of 5, 6, 7, or 8 bits; even, odd or no parity; 1, 1-1/2 or 2 stop bits.

With the R6551, a crystal is the only required external support component — eliminating the multiple-component support that is typically needed.

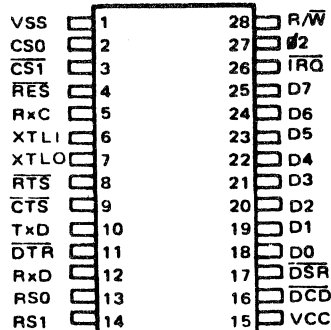

In addition, the R6551 is designed for maximum programmed control from the CPU, to simplify hardware implementation. A control register and a separate command register permit the CPU to easily select the R6551's operating modes and check data, parameters and status.

### FEATURES

- Compatible with 8-bit microprocessors
- Full duplex or half duplex operation with buffered receiver and transmitter
- 15 programmable Baud Rates (50 to 19,200)
- Receiver data rate may be identical to baud rate or may be 16 times the external clock input
- Data set/modem control functions
- Programmable word lengths, number of stop bits, and parity bit generation and detection
- Programmable interrupt control
- Software reset
- Program-selectable serial echo mode
- Two chip selects
- 2 MHz or 1 MHz clock rate
- Single +5V ±5% power supply
- 28-pin plastic or ceramic DIP
- Full TTL compatibility

### Ordering Information

Order Number	Package Type	Frequency	Temperature Range
R6551P	Plastic	1 MHz	0°C to +70°C
R6551AP	Plastic	2 MHz	0°C to +70°C
R6551C	Ceramic	1 MHz	0°C to +70°C
R6551AC	Ceramic	2 MHz	0°C to +70°C

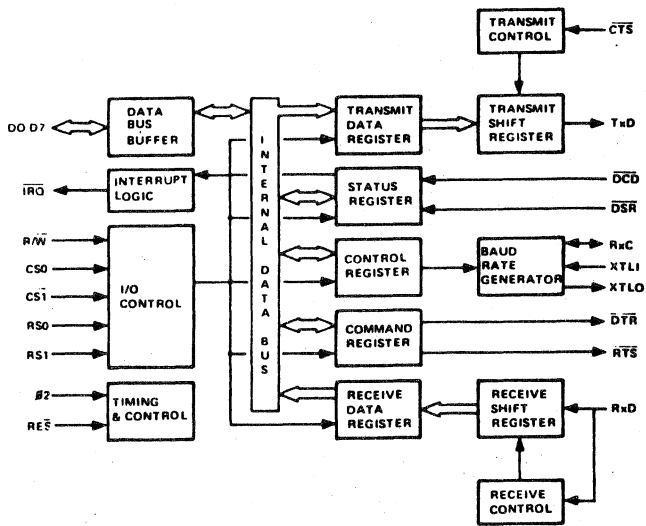

R6551 Pin Configuration

R6551 Interface Diagram

Asynchronous Communication Interface Adapter (ACIA)

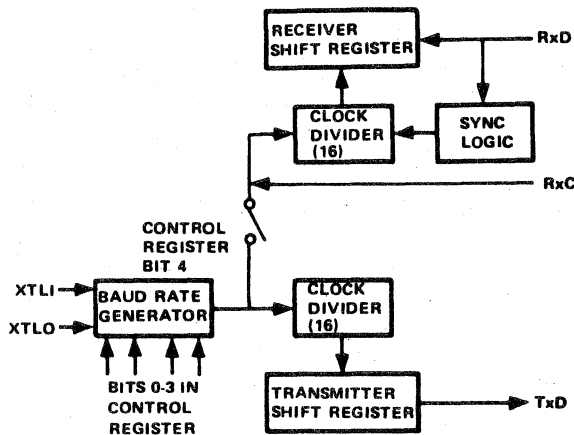

# INTERNAL ORGANIZATION

R6551 Block Diagram

## Transmitter/Receiver

Bits 0-3 of the Control Register select the divisor used to generate the baud rate for the Transmitter. If the Receiver clock is to use the same baud rate as the Transmitter, then RxC becomes an output pin and can be used to slave other circuits to the R6551.

Transmitter/Receiver Clock Circuits

## Transmit and Receive Data Registers

These registers are used as temporary data storage for the 6551 Transmit and Receive circuits. The Transmit Data Register is characterized as follows:

- Bit 0 is the leading bit to be transmitted.
- Unused data bits are the high-order bits and are "don't care" for transmission.

The Receive Data Register is characterized in a similar fashion:

- Bit 0 is the leading bit received.
- Unused data bits are the high-order bits and are "0" for the receiver.
- Parity bits are not contained in the Receive Data Register, but are stripped-off after being used for external parity checking. Parity and all unused high-order bits are "0".

## Control Register

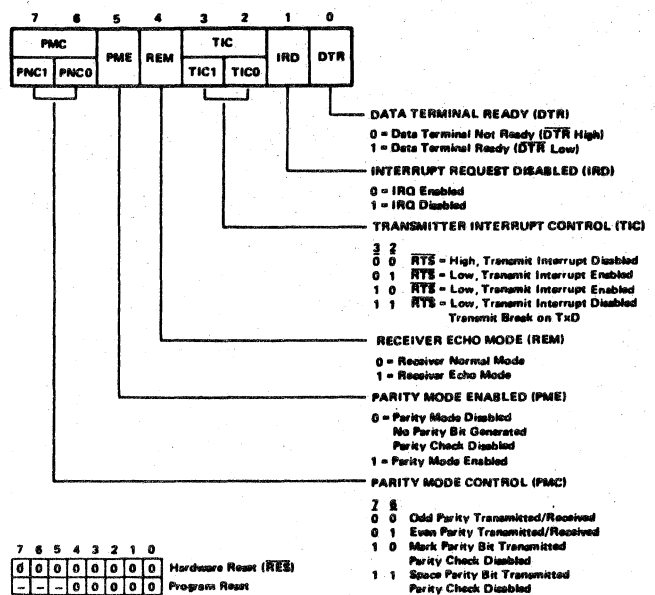

The Control Register selects the desired baud rate, frequency source, word length, and the number of stop bits.

R6551 Control Register

## Command Register

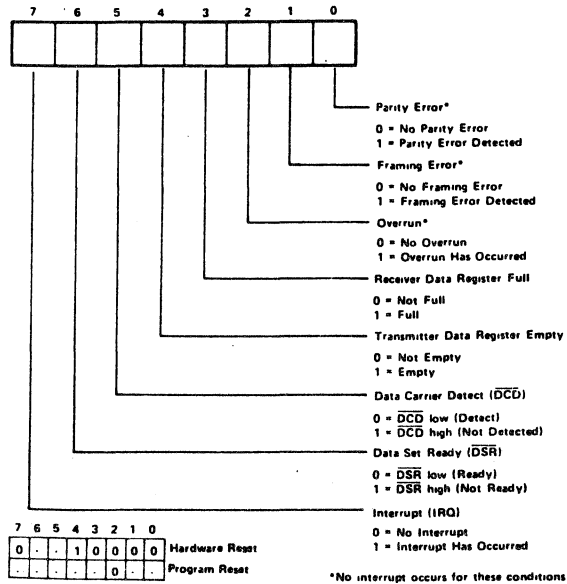

The Command Register controls specific modes and functions.

R6551 Command Register

## Status Register

The Status Register reports the status of various R6551 functions

R6551 Status Register

## INTERFACE SIGNAL DESCRIPTION

### RES (Reset)

During system initialization a low on the  $\overline{\text{RES}}$  input will cause internal registers to be cleared.

### $\emptyset 2$ (Input Clock)

The input clock is the system  $\emptyset 2$  clock and is used to synchronize all data transfers between the system microprocessor and the R6551.

### R/W (Read/Write)

The R/W is generated by the microprocessor and is used to control the direction of data transfers. A high on the R/W pin allows the processor to read the data supplied by the R6551. A low on the R/W pin allows a write to the R6551.

### IRQ (Interrupt Request)

The  $\overline{\text{IRQ}}$  pin is an interrupt output from the interrupt control logic. It is an open drain output, permitting several devices to be connected to the common  $\overline{\text{IRQ}}$  microprocessor input. Normally a high level,  $\overline{\text{IRQ}}$  goes low when an interrupt occurs.

### D0-D7 (Data Bus)

The D0-D7 pins are the eight data lines used to transfer data between the processor and the R6551. These lines are bi-directional and are normally high-impedance, except during Read cycles when the R6551 is selected.

### CS0, CS1 (Chip Selects)

The two chip select inputs are normally connected to the processor address lines either directly or through decoders. The R6551 is selected when CS0 is high and CS1 is low.

### RS0, RS1 (Register Selects)

The two register select lines are normally connected to the processor address lines to allow the processor to select the various R6551 internal registers. The following table indicates the internal register select coding:

RS1	RS0	Write	Read
0	0	Transmit Data Register	Receiver Data Register
0	1	Programmed Reset (Data is "Don't Care")	Status Register
1	0	Command Register	
1	1	Control Register	

Note that only the Command and Control registers are read/write. The Programmed Reset operation does not cause any data transfer, but is used to clear Bits 0 through 4 in the Command Register and Bit 2 in the Status Register. The Programmed Reset is slightly different from the Hardware Reset ( $\overline{\text{RES}}$ ); these differences are described in the individual register definitions.

## ACIA/Modem Interface Signal Description

### XTLI, XTLO (Crystal Pins)

These pins are normally directly connected to the external crystal (1.8432 MHz) used to derive the various baud rates. Alternatively, an externally generated clock may be used to drive the XTLI pin, in which case the XTLO pin must float. XTLI is the input pin for the transmit clock.

### TxD (Transmit Data)

The TxD output line is used to transfer serial NRZ (non-return-to-zero) data to the modem. The LSB (least significant bit) of the Transmit Data Register is the first data bit transmitted and the rate of data transmission is determined by the baud rate selected, or under control of an external clock (as selected by the Control Register).

### RxD (Receive Data)

The RxD input line is used to transfer serial NRZ data into the ACIA from the modem, LSB first. The receiver data rate is either the programmed baud rate or the rate of an externally generated receiver clock (as selected by the Control Register).

### RxC (Receive Clock)

The RxC is a bi-directional pin which serves as either the receiver 16x clock input or the receiver 16x clock output. The latter mode results if the internal baud rate generator is selected for receiver data clocking.

### RTS (Request to Send)

The  $\overline{\text{RTS}}$  output pin is used to control the modem from the processor. The state of the  $\overline{\text{RTS}}$  pin is determined by the contents of the Command Register.

### CTS (Clear to Send)

The  $\overline{\text{CTS}}$  input pin is used to control the transmitter operation. The enable state is with  $\overline{\text{CTS}}$  low. The transmitter is automatically disabled if  $\overline{\text{CTS}}$  is high.

### DTR (Data Terminal Ready)

This output pin is used to indicate the status of the R6551 to the modem. A low on  $\overline{\text{DTR}}$  indicates the R6551 is enabled and a high indicates it is disabled. The processor controls this pin via bit 0 of the Command Register.

### DSR (Data Set Ready)

The  $\overline{\text{DSR}}$  input pin is used to indicate to the R6551 the status of the modem. A low indicates the "ready" state and a high, "not-ready".  $\overline{\text{DSR}}$  is a high-impedance input, and must be connected. If unused, it should be driven high or low, but not switched.

### DCD (Data Carrier Detect)

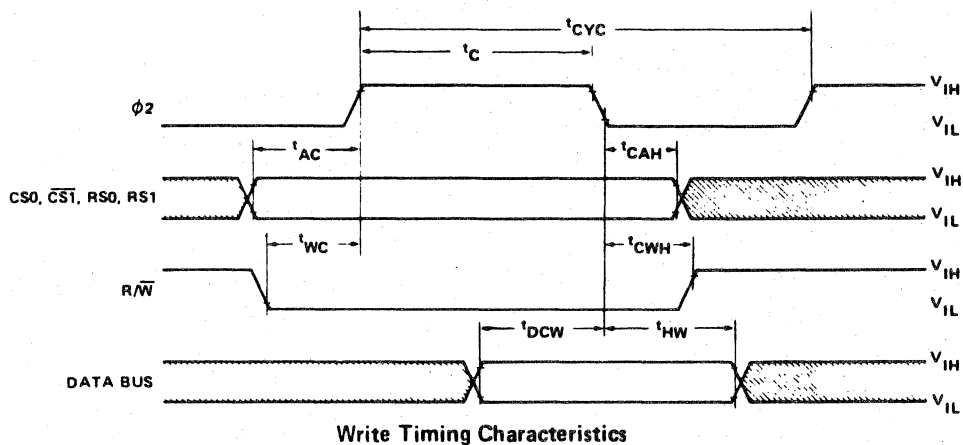

The  $\overline{\text{DCD}}$  input pin is used to indicate to the R6551 the status of the carrier-detect output of the modem. A low indicates that the modem carrier signal is present and a high, that it is not. Like  $\overline{\text{DSR}}$ ,  $\overline{\text{DCD}}$  is a high-impedance input, and must be connected.

## READ/WRITE CYCLE CHARACTERISTICS

( $V_{CC} = 5.0V \pm 5\%$ ,  $T_A = 0$  to  $70^\circ\text{C}$ , unless otherwise noted)

Characteristic	Symbol	1 MHz		2 MHz		Unit
		Min	Max	Min	Max	
Cycle Time	$t_{\text{CYC}}$	1.0	40	0.5	40	$\mu\text{s}$
$\phi 2$ Pulse Width	$t_{\text{C}}$	400	—	200	—	ns
Address Set-Up Time	$t_{\text{AC}}$	120	—	70	—	ns
Address Hold Time	$t_{\text{CAH}}$	0	—	0	—	ns
$\overline{\text{R/W}}$ Set-Up Time	$t_{\text{WC}}$	120	—	70	—	ns
$\overline{\text{R/W}}$ Hold Time	$t_{\text{CWH}}$	0	—	0	—	ns
Data Bus Set-Up Time	$t_{\text{DCW}}$	150	—	60	—	ns
Data Bus Hold Time	$t_{\text{HW}}$	20	—	20	—	ns
Read Access Time (Valid Data)	$t_{\text{CDR}}$	—	200	—	150	ns
Read Hold Time	$t_{\text{HR}}$	20	—	20	—	ns
Bus Active Time (Invalid Data)	$t_{\text{CDA}}$	40	—	40	—	ns

( $t_r$  and  $t_f = 10$  to  $30$  ns)

Write Timing Characteristics

Read Timing Characteristics

## TRANSMIT/RECEIVE CHARACTERISTICS

Characteristic	Symbol	1 MHz		2 MHz		Unit
		Min	Max	Min	Max	
Transmit/Receive Clock Rate	$t_{CCY}$	400*	—	400*	—	ns
Transmit/Receive Clock High Time	$t_{CH}$	175	—	175	—	ns

|---|---|

The Intel® 8048H/8048H-1/8035HL/8035HL-1 are totally self-sufficient, 8-bit parallel computers fabricated on single silicon chips using Intel's advanced N-channel silicon gate HMOS process.

The 8048H contains a 1K X 8 program memory, a 64 X 8 RAM data memory, 27 I/O lines, and an 8-bit timer/counter in addition to on-board oscillator and clock circuits. For systems that require extra capability the 8048H can be expanded using standard memories and MCS-80™/MCS-85™ peripherals. The 8035HL is the equivalent of the 8048H without program memory and can be used with external ROM AND RAM.

To reduce development problems to a minimum and provide maximum flexibility, a logically and functionally pin compatible version of the 8048H with UV-erasable user-programmable EPROM program memory is available. The 8748 will emulate the 8048H up to 6 MHz clock frequency with minor differences.

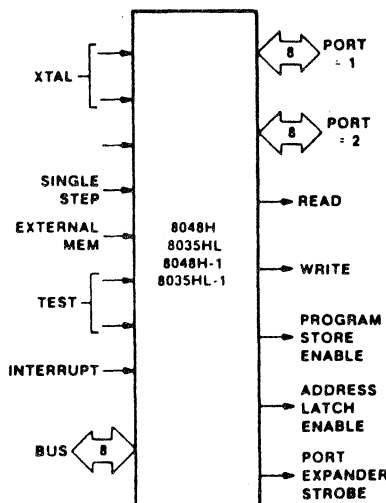

The 8048H is fully compatible with the 8048 when operated at 6 MHz.

These microcomputers are designed to be efficient controllers as well as arithmetic processors. They have extensive bit handling capability as well as facilities for both binary and BCD arithmetic. Efficient use of program memory results from an instruction set consisting mostly of single bit instructions and no instructions over 2 bytes in length.

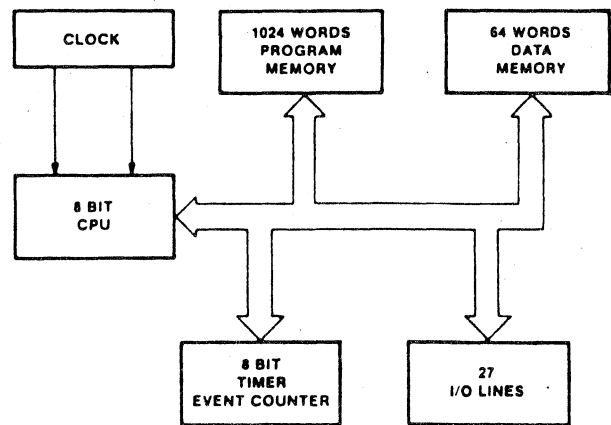

## PIN CONFIGURATION

## LOGIC SYMBOL

## BLOCK DIAGRAM

**PIN DESCRIPTION**

Designation	Pin =	Function	Designation	Pin =	Function
V <sub>SS</sub>	20	Circuit GND potential			testable with conditional jump instruction. (Active low)
V <sub>DD</sub>	26	Low power standby pin			
V <sub>CC</sub>	40	Main power supply; +5V during operation.	$\overline{RD}$	8	Output strobe activated during a BUS read. Can be used to enable data onto the bus from an external device.
PROG	25	Output strobe for 8243 I/O expander.			
P10-P17 Port 1	27-34	8-bit quasi-bidirectional port.			Used as a read strobe to external data memory. (Active low)
P20-27 Port 2	21-24	8-bit quasi-bidirectional port.	$\overline{RESET}$	4	Input which is used to initialize the processor. (Active low) (Non TTL V <sub>IH</sub> )
	35-38	P20-P23 contain the four high order program counter bits during an external program memory fetch and serve as a 4-bit I/O expander bus for 8243.	$\overline{WR}$	10	Output strobe during a bus write. (Active low)
DB0-DB7 BUS	12-19	True bidirectional port which can be written or read synchronously using the $\overline{RD}$ , $\overline{WR}$ strobes. The port can also be statically latched.  Contains the 8 low order program counter bits during an external program memory fetch, and receives the addressed instruction under the control of $\overline{PSEN}$ . Also contains the address and data during an external RAM data store instruction, under control of ALE, $\overline{RD}$ , and $\overline{WR}$ .	ALE	11	Address latch enable. This signal occurs once during each cycle and is useful as a clock output.  The negative edge of ALE strobes address into external data and program memory.
			$\overline{PSEN}$	9	Program store enable. This output occurs only during a fetch to external program memory. (Active low)
			$\overline{SS}$	5	Single step input can be used in conjunction with ALE to "single step" the processor through each instruction. (Active low)
TO	1	Input pin testable using the conditional transfer instructions JT0 and JNT0. TO can be designated as a clock output using ENT0 CLK instruction.	EA	7	External access input which forces all program memory fetches to reference external memory. Useful for emulation and debug, and essential for testing and program verification. (Active high)
T1	39	Input pin testable using the JT1, and JNT1 instructions. Can be designated the timer/counter input using the STRT CNT instruction.	XTAL1	2	One side of crystal input for internal oscillator. Also input for external source. (Non TTL V <sub>IH</sub> )
$\overline{INT}$	6	Interrupt input. Initiates an interrupt if interrupt is enabled. Interrupt is disabled after a reset. Also	XTAL2	3	Other side of crystal input.

**INSTRUCTION SET**
**Accumulator**

Mnemonic	Description	Bytes	Cycles
ADD A, R	Add register to A	1	1

## VIDEO MONITOR

The video monitor contains two sections: the vertical amplifier and the horizontal amplifier. These amplifiers provide the voltages necessary to drive the CRT yoke, which deflects the electron beam across the CRT.

The electron beam, which is generated by the CRT electron gun, sweeps across and down the screen to create scan lines (see section on character generation). The beam's movement is driven by vertical and horizontal sweep rates, which are determined by the display circuitry on the logic board. The horizontal sweep is approximately 16 KHz, the vertical sweep 60 Hz for domestic and 50 Hz for European applications.

The horizontal synch pulses coming into the video monitor are inverted and amplified by transistor Q301. This signal is then coupled across the drive transformer T301 and applied to the base of the output transistor Q302. Q302's output drives both horizontal yoke windings, as well as the step-up transformer that produces the anode voltage and the grid voltage for the CRT grid in the neck of the CRT. Since high-frequency magnetic fields are produced and then broken, the flyback transformer is necessary to provide high voltages for the horizontal scans.

These horizontal scans start in the upper left corner and scan across to the upper right corner. Once the scan reaches the end of the line, a blank appears where the video beam is turned off and retraced to the beginning of the next scan line.

The vertical synch pulses coming into the video monitor are converted to a sawtooth waveform. Initially, this pulse goes from a negative leading edge to a positive falling edge and passes through transistor Q202, which inverts it to its usable form.

At that point, the pulse goes from a +2-volt leading edge to a -2.5-volt falling edge. Timing is critical since 250 horizontal scan lines (which comprise the total number of horizontal scan lines on the CRT) occur within one sawtooth pulse. Therefore, the sawtooth pulse has to be proportional to all previous pulses or the timing will be off for the vertical as well as the horizontal sweep.

When the vertical sweep is negative, Q201 conducts and C202 discharges. During the positive portion, Q201 cuts off and allows C202 to charge. While C202 is charging, the electron beam scans.

The vertical sweep scans from top to bottom. Once it reaches the bottom of the page, a blank occurs when the video beam is turned off and is retraced to the top of the screen. At that point, C202 discharges. After the retrace, the beam turns off again and begins its scan routine.

Adjusting SFR1 (vertical height) and SFR2 (vertical linearity) changes the rate of C202's charge, and therefore the slope of the sawtooth pulse.

## POWER SUPPLY

Voltages are created and regulated as follows: A 9.8 AC voltage is rectified by diodes D105 and D108, resulting in a 9-volt output. These 9 volts are then filtered through C117 and applied at the 5-volt regulator IC2.

The raw AC voltages for the positive and negative 12 DC voltage are derived from the center top of the secondary winding of D101. The diodes D101 and D102 form a full-wave rectifier that converts the 37-volt AC waveform to a 20-volt DC level. This DC voltage is then filtered by C116 and stabilized to -12 volts by a zener-regulated circuit that consists of a resistor (R102) and the zener diode (D112).

Diodes D103 and D104 also form a full-wave rectifier that converts the 37-volt AC waveform to a +20-volt DC level.

This DC voltage is filtered by C113 and applied to the 13.8-volt regulator IC1. The 13.8 output, in turn, is dropped 1.6 volts across diodes D113 and D114 to achieve the desired +12 volts DC.

A 79-volt AC waveform is applied to the half-wave rectifier D109, which is filtered by C119. The resulting 95-volt DC level is then regulated by a series voltage regulator. The reference element is the positive 12-volt zener diode D111. The sensing and control elements are transistors Q103 and Q102.

The high voltages needed to drive the CRT tube V501 are derived from the flyback transformer T302 on the video module.

TUBE SPECIFICATION

12 INCH 90 DEGREE, HIGH RESOLUTION

DISPLAY TUBE

310KGB 31

The 310KGB31 is a 12 inch 90 degree high resolution, rectangular display tube primarily intended for use as a alpha-numerical and graphic display tube for computer peripheral devices. The tube is provided with banded type integral implosion protection (with mounting lugs). The tube features a low reflectance high contrast screen.

ELECTRICAL DATA

Heating

Indirect by AC or DC:

Heater voltage. . . . . 12.0 volts  
Heater current. . . . . 75 mA

Focusing Method. . . . . Electrostatic

Deflection Method. . . . . Magnetic

Deflection Angles (Approx.)

Diagonal. . . . . 90 degrees  
Horizontal. . . . . 78 degrees  
Vertical. . . . . 61 degrees

Anode voltage . . . . . 15,000 max. volts  
8,000 min. volts

Using high voltage with this tube internal flash-overs may occur, which may cause damage to the cathode of the tube and to various circuit components on the video monitor board. Therefore it is necessary to provide protective circuits using spark-gaps etc. These should be connected as illustrated in figure #1 below.

Figure 1.

No other connections between external conductive coating and chassis are permissible.

OPTICAL DATA

Faceplate . . . . . Filterglass  
Anti-reflection treatment . . . . . No  
Screen . . . . . Aluminized  
Appearance . . . . . Low Reflective

A: The dark-colored screen, in combination with the filterglass, produces the low reflectivity (equivalent to a 20% light transmission filterglass) for easy-to-see display.

MECHANICAL DATA

Tube Dimensions:

Overall length . . . . . 278.8 max. mm  
Greatest dimensions of tube (excluding lugs)  
Diagonal . . . . . 318.5 +/- 2.7 mm  
Width . . . . . 279.6 +/- 2.7 mm  
Height . . . . . 218.7 +/- 2.7 mm  
Useful screen dimensions (projected)  
Diagonal . . . . . 295.0 min. mm  
Width . . . . . 257.0 min. mm  
Height . . . . . 195.0 min. mm

Pin Position Alignment . . . . . Pin No 5 aligns approx. with anode contact.  
Operating Position . . . . . Any  
Weight (approx.) . . . . . 3.2 kg  
Implosion Protection . . . . . Tension band (with mounting lugs)

GENERAL CONSIDERATIONS:

1. Tube handling. Care should be taken not to scratch the tube.
2. Impact. The tubes should never be exposed to impacts of more than 30G during handling or transportation.
3. Grounding. The external conductive coating of the tube should be grounded with multiple contacts (e.g. a contact plate having many fingers.) Poor contact might cause local heating resulting in tube leakage.

**WARNING**

**SHOCK HAZARD:**

The high voltage at which the tube is operated may be very dangerous. Design of the equipment should include safeguards to prevent the user from coming in contact with the high voltage. Extreme care should be taken in the servicing or adjustment of any high voltage circuit.

Caution must be exercised during the replacement or servicing of the tube since a residual electrical charge is stored within the tube. Before handling the tube remove any undersible residual high voltage charge from the tube, by shorting the anode contact button to the frame of the terminal as illustrated in figure #2. Discharging the high voltage to isolated metal parts such as cabinets and control brackets may produce a shock hazard.

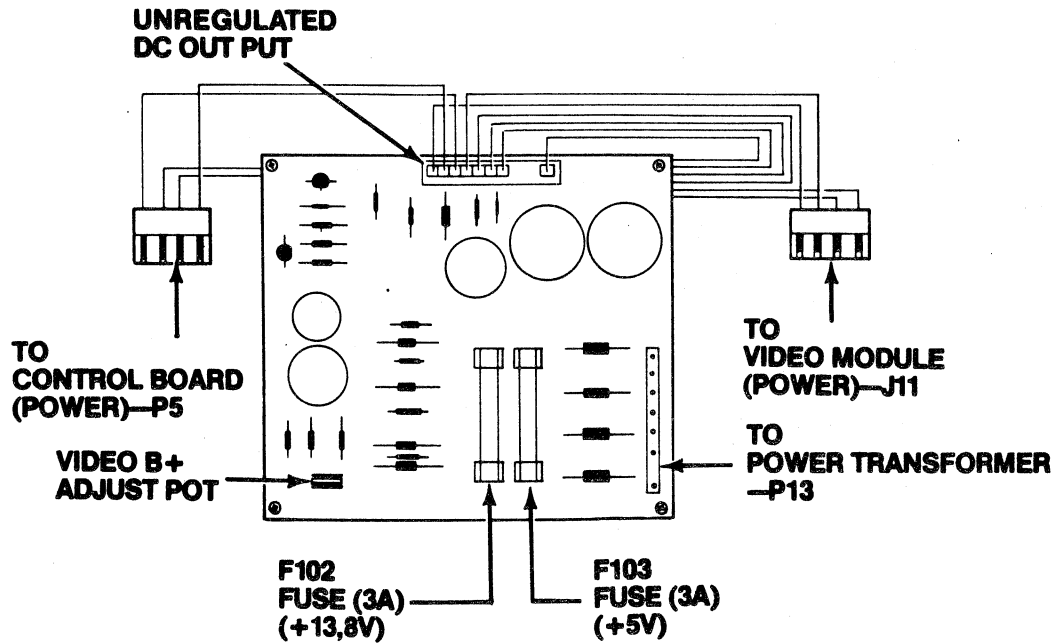

Figure 2.

Sunnyvale, California 94086

## 1. INTRODUCTION

This is a general troubleshooting guide to be used with the Operator's Manual, Maintenance Manual, and Service Bulletins as required. By following the procedures described here, you should be able to quickly isolate and repair most field failures.

The following sections are included:

	Page
Overview of Terminal Modules	2-1
Functional Description of Modules	3-1
Troubleshooting the Logic Board	4-1
Visual Inspection	4-1
Large Scale Integration Failures	4-2
Data Line Operation	4-3
Debugging Tables for TTL Boards	4-4
Debugging Tables for GA Boards	4-12
Troubleshooting the Keyboard	5-1
Visual Inspection	5-1
Debugging Table	5-3
Troubleshooting the Video Monitor	6-1
Visual Inspection	6-1
Debugging Guide	6-3
Troubleshooting the Power Supply	7-1
Visual Inspection	7-1
Debugging Guide	7-2

## 2. OVERVIEW OF TERMINAL MODULES

The design of TeleVideo® terminals permits fast fault isolation since the terminal hardware is divided into four main modules:

1. Video monitor
2. Power supply
3. Main logic board
4. Keyboard

The video monitor and power supply are common to all TeleVideo terminals and may be freely interchanged. Terminal keyboards are interchangeable, as outlined in the section on the keyboard. The main logic board is the only module that provides each terminal with its unique characteristics.

The quickest and easiest way to isolate the malfunctioning module is to exchange (swap) each module with a known good module. Once the faulty module is identified, refer to the appropriate troubleshooting table.

### WARNING!

High voltages are retained by the CRT tube and capacitors even after power has been turned off. As soon as you open the case, clip one end of a wire to the chassis. Attach the other end of the wire to an insulated screwdriver. Being careful not to touch the metal part of the screwdriver, gently slip the metal end of the screwdriver under the cap of the anode, as shown in Figure 2-1.

Figure 2-1 Discharging Voltages

### 3. FUNCTIONAL DESCRIPTION OF MODULES

#### Logic Board

The logic board processes and controls all data received and transmitted, and generates the video and sync signals required to display data.

The logic board consists of the following five functional areas:

1. Display processor
2. Display generator
3. Keyboard interface
4. Main port interface
5. Printer port interface

#### Power Supply

The power supply provides DC operating voltages to all circuits in the terminal. The power supply contains two user-replaceable 3 AG-type fuses.

#### Video Monitor

The video monitor contains horizontal, vertical, and intensity modulation circuits which produce a television-type conventional noninterlaced raster display on the screen. Character signals received from the display generator cause intensified dots to appear at precise intervals on a raster line. These dots, when combined with other dots on other raster lines above and/or below a given line, produce characters.

#### Keyboard

910/910 PLUS/912C/920C--This keyboard sends matrixed data via a ribbon cable to the logic board, where the ASCII code is generated.

This data is encoded in the 910/910 PLUS by the keyboard encoder (position A1) and in the 912C/920C by the CPU (position A54) and the multiplexers (positions A68 and A69).

The keyboards for these models are all functionally interchangeable. The 910/910 PLUS keyboard has a PRINT keycap where 912C/920C models have a BLOCK/CONV keycap. The 920C keyboard is also fitted with an additional top row of function and editing keys.

925/950--On this keyboard, data is encoded by a microprocessor on the keyboard (position U6) and sent in an ASCII serial data stream to the logic board via the coiled cable. On the logic board, the keyboard interface circuits convert the keyboard data from serial to parallel data for input to the display processor circuitry. All detachable keyboards are identical and interchangeable.

#### 4. TROUBLESHOOTING THE LOGIC BOARD

##### Visual Inspection

With the Logic Board Installed--Turn off power to the terminal, open the case, and check the following possible problem areas:

- \* Internal and external switch settings: are they all correct?
- \* Socketed chips: are they all plugged tightly into their sockets?
- \* Connectors: look for
  - Loose or damaged connectors
  - Broken or loose securing clips on pins at connectors
  - Bad crimps
  - Dirty contacts
- \* Wires: are any broken, loose, or frayed?
- \* Components: are any overheated or burned?

With the Logic Board Removed--Make these inspections with the logic board removed. The procedure for removing the logic board varies slightly according to the model. Follow the appropriate directions for your model.

##### 910/910 PLUS/912C/920C

To remove the logic board:

1. Turn the power off.
2. On the logic board, disconnect:
  - P1 (keyboard input)
  - P2 (video signals)
  - P3 (RS232C port) if connected
  - P4 (printer port) if connected
  - P5 (voltage connector)
  - P6 (modem connector) if connected
  - P7 (speaker connector)
3. Remove the four (910/910 PLUS) or six (912C/920C) securing screws on the logic board.
4. Carefully remove the logic board.

925/950

1. Turn the power off.
2. On the logic board, disconnect:
  - P1 (keyboard input)
  - P3 (RS232C port) if connected
  - P4 (printer port) if connected
  - P6 (modem connector) if connected
3. Carefully slide the logic board half way out of the terminal and disconnect:
  - P2 (video signals)
  - P5 (voltage connector)
4. Carefully slide the logic board entirely out of the terminal.

With the logic board removed, inspect the logic board for:

- \* Overheated or burned components
- \* Missing or broken components
- \* Cracked, broken, or lifted traces
- \* Poor solder joints (loose solder balls, cold solder joints, or solder bridges)
- \* Bent pins

**STOP!**

If defects are found, correct them and recheck the terminal before continuing.

If no defects are found, reinstall the logic board before proceeding with the procedures in the next section, Large Scale Integration Failures.

#### **Large Scale Integration Failures**

Since most failures involve Large Scale Integration (LSI) chips, this step will quickly repair most failures encountered. Exchange all socketed chips, one at a time, with known good chips. If the logic board malfunctions after the chips are swapped, confirm the operation of the data lines described in the next section, Data Line Operation.

**NOTE!**

The remainder of this guide involves troubleshooting to the component level and requires schematics, an oscilloscope, a working knowledge of transistor-transistor logic (TTL), and basic debugging skills.

**Data Line Operation**

Confirm that the data lines are operating properly before proceeding further.

**NOTE!**

It is beyond the scope of this bulletin to list all possible data line problems.

The best place to check the data lines is directly from the CPU (see page 1 of the schematics). There should be activity on all data lines and the signals should range from 0 (ground) to +4.5 to +5.0 volts. If the malfunction persists after you have confirmed proper operation of the data lines, follow the procedures in the next section, Debugging Tables.

**Debugging Tables**

**NOTE!**

The items listed in the tables in this section are only suspect areas; they should not be automatically replaced when the symptoms listed are present.

Table 4-1 910/910 PLUS Logic Board Debugging Guide

Symptom	Suspect Areas		Schematic Page

**"Gate Array" Logic board,  
Supplement Debugging Guide**

Although the components are laid out differently, "Gate Array" boards are completely interchangeable with TTL boards. When troubleshooting the "Gate Array" Logic boards care should be taken when handling the CMOS devices. The "Gate Array" chip positions are listed below. When exchanging these custom CMOS chips one must be grounded to earth ground to avoid damage to the chip from static discharge.

Model No.	Televideo Part Number	Location
910, 910Plus	2057400	A22
925	2057400	A39
950, Chip A	2057600	A34
Chip B	2057800	A37

Follow the procedure in the beginning of this section for a visual inspection of the logic board.

## 5. TROUBLESHOOTING THE KEYBOARD

### Visual Inspection

With the Keyboard Installed--Turn off power to the terminal. Check keyboard alignment; are any keys binding on the cover?

Open the top case.

#### 910/910 PLUS/912/920

Remove the two screws from the bottom front corners of the terminal. Carefully tip the top case back until it rests on a firm surface.

#### NOTE!

The terminal will now be top heavy and may tip over if there is not sufficient table space to support the top.

#### 925/950

Remove the four screws from the bottom of the keyboard case. Carefully lift off the top of the keyboard case and set it aside.

Check the following areas:

\* Key switches:

Foreign objects (e.g., paperclips, staples, matches)

Liquid residue (e.g., coffee, soft drinks)

Broken keyswitches

Missing or incorrectly placed keycaps

\* Cables:

Broken wires

Loose wires at connectors

Creased, kinked, or cut cables

\* Connectors:

Loose or damaged connectors

Bent pins

Dirty contacts

**NOTE!**

If defects are found, correct them and recheck the terminal before continuing.

With the Keyboard Removed--Make the following inspections with the keyboard removed from its case. The procedure for removing the keyboard varies slightly according to the model.

**910/910 PLUS/912/920**

To remove the keyboard:

1. Unplug the ribbon cable from the logic board.
2. Remove the two securing screws and washers from the inner bottom corners of the keyboard.
3. Carefully remove the keyboard from the surrounding case.

**925/950**

To remove the keyboard:

1. Disconnect on the keyboard:
  - P6 (speaker connector)
  - P7 (keyboard cable)
2. Remove the four screws from the bottom corners of the keyboard case.
3. Carefully remove the keyboard from the bottom case.

Inspect the keyboard for:

- \* Overheated, damaged, or burned components
- \* Cracked, shorted, broken, or lifted traces
- \* Poor solder joints (loose solder balls, cold solder joints, or solder bridges)
- \* Broken, loose, or frayed wires

**NOTE!**

If any defects are found, correct them and recheck before continuing.

Table 5-1 Keyboard Debugging Guide

Symptom	Suspect Areas	Models
One key inoperative/ intermittent	Respective keyswitch	A
	Open trace/bad solder joint	A
	8048 keyboard CPU, position U6	B
Several keys inoper- ative/intermittent	Open/shorted trace	A
	Broken/loose jumper	A
	Defective ribbon cable	C, D
	Bent pin at ribbon cable connectors	C, D
	8048 keyboard CPU, position U6	B
	10K ohm resistor packs, positions RP2, RP3	B
All keys inoperative	10K ohm resistor, position R3	B
	Open/shorted trace	A
	Defective ribbon or keyboard cable	A
	8048 keyboard CPU, position U6	B
	7805 +5V regulator, position V1	B
5.7143-MHz crystal, position X1	B	
SHIFT, FUNCT, or ALPHA LOCK keys	10K ohm resistor pack, position RP2	
	8048 keyboard CPU, position U6	B
CTRL key inoperative	10K ohm resistor pack, position R2	
	8048 keyboard CPU, position U6	B
Incorrect characters	Shorted trace	A
	Shorted/improperly plugged ribbon cable	C, D
	8048 keyboard CPU, position U6	B

Legend

A = All

B = 925/950

C = 910/910 PLUS

D = 912/920

Table 5-1 Continued

Symptom	Suspect Areas	Models
Keys repeat	Respective keyswitch*	B, D
	Shorted trace	A
	Shorted ribbon cable	C, D
	8048 keyboard CPU, position U6	B

Legend

A = All

B = 925/950

C = 910/910 PLUS

D = 912/920

Note

\*On the 910/910 PLUS terminals, a key which is shorted will not repeat on power up. Instead, any key pressed will repeat until another key is pressed.

## 6. TROUBLESHOOTING THE VIDEO MONITOR

### Visual Inspection

With the Video Monitor Installed--Turn off power to the terminal, open the case, and check the following possible problem areas:

- \* Connectors: look for
  - Loose or damaged connectors
  - Broken or loose securing clips on pins at connectors
  - Bad crimps
  - Dirty contacts
- \* Wires: are any broken, loose, or frayed?
- \* Components: are any overheated, leaking, or burned?

If any defects are found, correct them and recheck the terminal before continuing.

With the Video Monitor Removed--The following inspections should be made with the video monitor removed.

To remove the video monitor:

1. With the power off and the cover removed, disconnect the following connections on the video monitor:
  - J10 (signal input)
  - J11 (DC power)
  - J12 (yoke)
2. Disconnect the following parts on the CRT tube:
  - CRT socket (small printed circuit board at rear of tube)
  - Anode lead (SEE WARNING ON PAGE 2-1)
  - Ground wire
3. Remove the three securing screws on the video monitor.
4. Carefully remove the video monitor.

With the video monitor removed, inspect it for:

- \* Overheated, leaking, or burned components
- \* Missing or broken components
- \* Cracked, broken, or lifted traces
- \* Poor solder joints (loose solder balls, cold solder joints, or solder bridges)
- \* Bent pins

**NOTE!**

If defects are found, correct them and recheck the terminal before continuing.

If no defects are found, reinstall the video monitor.

Apply power.

**WARNING!**

High voltages are present on the video logic board. **USE EXTREME CARE** during troubleshooting.

The four adjustments which can be made to the video board are listed in Table 6-1. The controls are shown in Figure 6-1.

**Table 6-1 Video Board Adjustments**

<b>Problem</b>	<b>Control</b>
Characters are too bright or too dim	Brightness
Whole screen is too tall or too short	Height
Characters are not even in height from the top to the bottom of the screen	Linearity
Characters are not sharp	Focus

Figure 6-1 Location of Controls on Video Board

### Debugging Guide

This section will help you troubleshoot specific malfunctions. Table 6-2 lists voltage levels and wave forms.

#### **SYMPTOM: No Vertical Deflection**

1. Check Q201 collector for vertical deflection.
  - a. If it is present, proceed to Step 2.
  - b. If it is not present, check the base of Q201.
  - c. If vertical deflection is present at the base, isolate the Q201 collector to see if signal is being pulled down. If there is still no output at Q201, suspect Q201.
  - d. If vertical deflection is not present at the base, troubleshoot between the base of Q201 and P10 pin 5 (vertical sync signal from the logic board).
2. Check Q202 collector for vertical deflection.
  - a. If it is present, proceed to Step 3.
  - b. If it is not present, check the base of Q202.

Transistor			Base(In)			Collector(Out)			Emitter(GND)		
Locat - ion	Parts	Funct - ion	Vtg'		Wave Form	Vtg'		Wave Form	Vtg'		Wave Form
			DC V	AC V <sub>pp</sub>		DC V	AC V <sub>pp</sub>		DC V	AC V <sub>pp</sub>

Q102	2SC509	∞	78.7	0.0		86.4	1.5		98.0	0.0	
Q103	2SC983	∞	12.0	0.0		75.7	0.0		11.5	0.0	
Q 201	2SA495	Vert Pree Drive	2.0	3.0		0.6	0.57		1.0	1.7	
Q 202	2SC372	Vert Drive	0.68	0.5		8.0	6.5		0.0	0.0	
Q 203	2SC1173	Vert Out	9.36	6.5		12	0.0		8.76	6.5	
Q 204	2SA473	Vert Out	8.0	6.5		0.0	0.0		8.6	6.5	
Q 301	2SC735	Horiz Drive	-0.25	0.64		12	20		0.0	0.0	
Q 302	2SC2233	Horiz Out	-0.08	6		12.8	124		0.0	0.0	
Q 501	2SC983	Video Amp	0.4	3		76.8	25		-0.8	2.8	
D 302	DS-113A	Damping	12.8	132							

DC Voltage reading taken with VTVM from point indicated to chassis ground.

AC Voltage reading taken with Oscilloscope from point indicated to chassis ground

**Table 6-2 Voltage Levels and Waveforms**

- c. If vertical deflection is present at the base, isolate the Q202 collector to see if signal is being pulled down. If there is still no output at Q202, suspect Q202.
  - d. If vertical deflection is not present at the base, troubleshoot back from the base of Q202.
3. Check the negative side of C207 for vertical deflection.
- a. If vertical deflection is present, the vertical drive section of the video monitor is good. If a vertical problem still exists, check the following areas:
    - Connections
    - CRT socket
    - Related components (small pcb at neck of CRT)
  - b. If vertical deflection is not present at C207, check the Q203 emitter.
  - c. If vertical deflection is not present at the Q203 emitter, check the base of Q203.
  - d. If vertical deflection is present at the base, suspect Q203.
  - e. If not present at the base of Q203, troubleshoot back.
  - f. If Q203 emitter is good, check Q204 emitter.
  - g. If vertical deflection is not present at Q204 emitter, check the base of A204.
  - h. If present at base, suspect A204.
  - i. If not present at base, troubleshoot back from Q204.

**NOTE!**

Since Q203 and Q204 are a matched set of push/pull amplifiers, replace both if one require replacement.

**SYMPTOM: No Horizontal Deflections**

- 1. Check the Q301 deflector for horizontal deflections.
  - a. If horizontal deflections are present, proceed to Step 2.
  - b. If not present, check the base of Q301.

- c. If horizontal deflections are present at the base, isolate the Q301 collector to see if signal is being pulled down.
  - d. If there is no output at the Q301 collector, suspect Q301.
  - e. If horizontal deflections are not present at the base of Q301, troubleshoot between the base of Q301 and P10 pin 1 (horizontal sync signal from the logic board).
2. Check the Q302 deflector for horizontal deflections.
- a. If horizontal deflections are present, proceed to Step 3.
  - b. If not present, check the base of Q302.
  - c. If horizontal deflections are present at the base, isolate the Q302 collector to see if signal is being pulled down.
  - d. If there is no output at the Q302 collector, suspect A302.
  - e. If horizontal deflections are not present at the base of Q301, suspect T301 (drive transformer) or Q302.
  - f. If the proper signal is present at Q302 collector, suspect the following areas:

C306  
L201

**SYMPTOM: No Video**

1. Suspect the following areas:

L302  
Q302  
Q301  
T302 (FBT)  
C305  
Q501

2. Check for cracked, broken, or lifted traces.

**SYMPTOM: Jittery Screen**

- 1. Make sure that yoke connector J12 is not dirty.
- 2. Suspect C504.

3. Check for

\* Bad crimps

\* Poor solder joints (loose solder balls, cold solder joints, or solder bridges)

**SYMPTOM: Poor Linearity**

1. If horizontal linearity is the problem, check L201.
2. If vertical linearity is the problem, check the following:
  - a. Adjust SFT 2 (linearity potentiometer)
  - b. Q203 and Q204

**SYMPTOM: Fuses Blow and/or Voltage is Low**

1. Check T302 (FBT)
2. Check for cracked, broken, or lifted traces.

## 7. TROUBLESHOOTING THE POWER SUPPLY

### Visual Inspection

With the Power Supply Installed--Turn off power to the terminal, open the case, and check the following possible problem areas:

- \* Connectors: look for
  - Loose or damaged connectors
  - Broken or loose securing clips on pins at connectors
  - Bad crimps
  - Dirty contacts
  - Depressed pins in connectors
- \* Wires: are any broken, loose, or frayed?
- \* Components: are any overheated, leaking, or burned?
- \* Bad fuse

#### NOTE!

Check the fuse with an ohm meter. Do not rely on a visual check.

- \* Loose fuse holder

If defects are found, correct them and recheck the terminal before continuing.

With the Power Supply Removed--The following inspections should be made with the power supply removed.

To remove the power supply:

1. Turn the power off and remove the cover.
2. Unplug the power cord from the wall outlet.
3. Disconnect K1 (AC input) on the power supply.
4. Disconnect J11 on the video monitor.
5. Disconnect J5 on the logic board.
6. Remove the securing screws on the power supply (four on the 925/950; three on 910/910 PLUS/912/920).
7. Carefully remove the power supply.

With the Power Supply Removed--Inspect the power supply for:

- \* Overheated, leaking, or burned components
- \* Bad crimps
- \* Bad connectors/connections

**NOTE!**

If defects are found, correct them and recheck the terminal before continuing.

Disassemble the power supply by removing the four securing screws and spacers which hold the small pcb on the heat sink.

**Debugging Guide**

This section will help you troubleshoot specific malfunctions. Table 6-2 lists voltage levels and waveforms.

**SYMPTOM: No +5V DC**

1. Remove F103 and check for approximately +13V on one side of the fuseholder.

a. If correct voltage is not present, suspect the following areas:

C105 through C108

D105 through D108

Bad crimps

Loose or damaged connectors

Broken or loose securing clips on pins at connectors

b. If correct voltage is present, suspect the following areas:

F103 (fuse)

LAS1605

C114

C113

Bad crimps

Loose or damaged connectors

Broken or loose securing clips on pins at connectors

**SYMPTOM: +5V DC is Low**

1. Check the following areas:

LAS1605

Bad crimps

Loose or damaged connectors

Broken or loose securing clips on pins at connectors

**SYMPTOM:** No +12V DC or 13.8V DC

1. Remove F102 and check for +24V on one side of the fuseholder.
  - a. If correct voltage is not present, suspect the following areas:
    - C101 through C104
    - D101 through D104
    - Bad crimps
    - Bad connectors/connections
    - Broken or loose clips
  - b. If correct voltage is present, suspect the following areas:
    - LAS15CB/LAS16CB
    - C115
    - C113
    - Bad crimps
    - Loose or damaged connectors
    - Broken or loose securing clips on pins at connectors
