

**NAME**

curl\_multi\_remove\_handle - remove an easy handle from a multi session

**SYNOPSIS**

```
#include <curl/curl.h>
```

```
CURLMcode curl_multi_remove_handle(CURLM *multi_handle, CURL *easy_handle);
```

**DESCRIPTION**

Removes a given easy\_handle from the multi\_handle. This will make the specified easy handle be removed from this multi handle's control.

When the easy handle has been removed from a multi stack, it is again perfectly legal to invoke *curl\_easy\_perform()* on this easy handle.

Removing an easy handle while being used, will effectively halt the transfer in progress involving that easy handle. All other easy handles and transfers will remain unaffected.

**RETURN VALUE**

CURLMcode type, general libcurl multi interface error code.
