# Request for your special attention and precautions in using the technical information and semiconductors described in this book

- (1) An export permit needs to be obtained from the competent authorities of the Japanese Government if any of the products or technologies described in this book and controlled under the "Foreign Exchange and Foreign Trade Law" is to be exported or taken out of Japan.
- (2) The contents of this book are subject to change without notice in matters of improved function. When finalizing your design, therefore, ask for the most up-to-date version in advance in order to check for any changes.
- (3) We are not liable for any damage arising out of the use of the contents of this book, or for any infringement of patents or any other rights owned by a third party.
- (4) No part of this book may be reprinted or reproduced by any means without written permission from our company.
- (5) This book deals with standard specifications. Ask for the latest individual Product Standards or Specifications in advance for more detailed information required for your design, purchasing and applications.

If you have any inquiries or questions about this book or our semiconductors, please contact one of our sales offices listed at the back of this book.

## **About This Manual**

The MN101C51 series offers a choice of masked ROM version and user-programmable EPROM version, MN101CP28L. We're now developing flash EEPROM versions, which can be programmed by users.

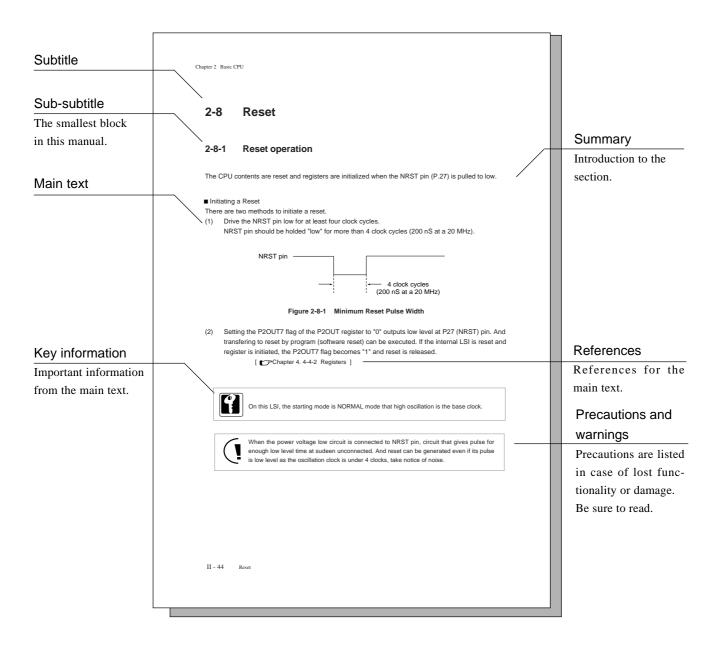

### ■Organization

In this LSI manual, the LSI functions are presented in the folowing order : overview, CPU basic functions, interrupt functions, port functions, timer functions, serial interface functions, and other peripheral hardware functions. Each section contains overview of function, block diagram, control register, operation, and setting example.

### Manual Configuration

Each section of this manual consists of a title, summary, main text, key information, precautions and warnings, and references.

The layout and definition of each section are shown below.

### Finding Desired Information

This manual provides three methods for finding desired information quickly and easily.

- (1) Consult the index at the front of the manual to locate the beginning of each section.
- (2) Consult the table of contents at the front of the manual to locate desired titles.
- (3) Chapter names are located at the top outer corner of each page, and section titles are located at the bottom outer corner of each page.

### Related Manuals

Note that the following related documents are available.

"MN101C Series LSI User's Manual" <Describes the device hardware.> "MN101C Series Instruction Manual" <Describes the instruction set.> "MN101C Series Cross-assembler User's Manual" <Describes the assembler syntax and notation.> "MN101C Series C Compiler User's Manual: Usage Guide" <Describes the installation, the commands, and options of the C Compiler.> "MN101C Series C Compiler User's Manual: Language Description" <Describes the syntax of the C Compiler.> "MN101C Series C Compiler User's Manual: Library Reference" <Describes the standard library of the C Compiler.> "MN101C Series C Source Code Debugger User's Manual" <Describes the use of C source code debugger.> "MN101C Series PanaX Series Installation Manual" <Describes the installation of C compiler, cross-assembler and C source code debugger and the procedure for bringing up the in-circuit emulator.>

#### Where to Send Inquires

We welcome your questions, comments, and suggestions. Please contact the semiconductor design center closest to you. See the last page of this manual for a list of addresses and telephone numbers.

## 1-1 Overview

### 1-1-1 Overview

The MN101C series of 8-bit single-chip microcontrollers incorporate multiple types of peripheral functions. This chip series is well suited for VCR, MD, TV, CD, LD, printer, telephone, home automation, pager, air conditioner, PPC, remote control, fax machine, musical instrument, and other applications.

The MN101C51 series brings to embedded microcomputer applications flexible, optimized hardware configurations and a simple efficient instruction set. This series have internal ROM 96 KB and internal RAM 6 KB. Peripheral functions include 5 external interrupts, 13 internal interrupts including NMI, 7 timer counters, 3 sets of serial interfaces, A/D converter, watchdog timer, automatic data transfer, synchronous output, buzzer output, and remote control output. The configuration of this microcontroller is well suited for application such as a system controller in a VCR selection timer, CD player, or MD.

With two oscillation systems (max. 20 MHz/32 kHz) contained on the chip, the system clock can be switched to high speed oscillation (**NORMAL mode**), or to low speed oscillation (**SLOW mode**). The system clock is generated by dividing the oscillation clock.

For example, in case of NORMAL mode, when the oscillation source (fosc) is 8 MHz, **minimum instructions execution time** is for 250 ns, and when fosc is 20 MHz, it is 100 ns. Available package : 80-pin LQFP.

### 1-1-2 Product Summary

This manual describes the following models of the MN101C51 series. These products have same peripheral functions.

This manual focuses on only MN101C51F, and MN101CF51G is separately bounded.

We also offer MN101CP28L of Mask ROM version. As for the differences between MN101C51F and MN101CP28L, reffer to the chapter 15. [ Table15-1-1. Defferences between Mask ROM versin and EPROM version ]

Model	ROM Size	RAM Size	Classification
MN101C51F* MN101CF51G*	96 KB 128 KB	6 KB 10 KB	Mask ROM version Flash EEPROM version
MN101CP28L	96 KB	10 KB	EPROM version

*3 : /	As for MN101CP28L, last	1 byte address of the internal ROM is reserved for
	ROM option.	
		plied for program development, be sure to write x'FF
C	on the last address x'1BFF	F' of the internal ROM address.
-		

Note that MN101C51F / MN101CF51G do not have ROM option.

Interrupts	13 Internal interrupts	
-	< Non-maskable interrupt (NMI) >	
	- Incorrect code execution interrupt and Watchdog timer int	errupt
	< Timer interrupts >	
	- Timer 0 interrupt	
	- Timer 1 interrupt	
	- Timer 2 interrupt	
	- Timer 3 interrupt	
	- Timer 4 interrupt	
	- Timer 5 interrupt	
	- Time base interrupt	
	< Serial interface interrupts >	
	- Serial interface 0 interrupt (Synchronous + Half-duplex U/	ART)
	- Serial interface 1 interrupt (Synchronous)	
	- Serial Interface 2 interrupt (Synchronous + singlemaster	IIC)
	< A/D interrupt >	
	- A/D converter interrupt	
	< Automatic transfer controller (ATC) interrupt >	
	- Automatic transfer interrupt	
	5 External interrupts	
	- IRQ0 : Edge selectable. With / Without noise filter.	
	- IRQ1 : Edge selectable. With / Without noise filter.	
	AC zero cross detector	
	- IRQ2 : Edge selectable. Synchronous output event.	
	- IRQ3 : Edge selectable.	
	- IRQ4 : Edge selectable. Key interrupt function.	
Timers		
	7 timers ( 6 can operate independently )	
	- 8-Bit timer for general use 3	sets
	- 8-Bit timer for general use (UART baud rate timer) 1	set
	- 8-Bit free-running timer 1	set
	Time base timer 1	set
	- 16-Bit timer for general use 1	set
	Timer 0 ( 8-Bit timer for general use )	
	- Square wave output ( Timer pulse output ), PWM output,	
	Event count, Remote control carrier output	
	- Clock source	
	fosc, fs, fs/4, TM0IO pin input	

#### Timer 1 (8-Bit timer for general use)

- Square wave output ( Timer pulse output ), Event count,
- Synchronous output event, 16-Bit cascade connection function
- (connect to timer 0)
- Clock source
  - fs/16, fs/64, fx, TM1IO pin input

#### Timer 2 (8-Bit timer for general use)

- Square wave output ( Timer pulse output ), PWM output, Event count,
- Synchronous output event
- Clock source
  - fs, fs/4, fx, TM2IO pin input

### Timer 3 (8-Bit timer for general use or UART baud rate timer)

- Square wave output (Timer pulse output), Event counter, Serial interface transfer clock output, 16-Bit cascade connection function (connect to timer
   2) Remete control corrier output
- 2), Remote control carrier output
- Clock source
  - fosc, fs/4, fs/16, TM3IO pin input

#### Timer 4 (16-Bit timer for general use)

- Square wave output (Timer pulse output), PWM output, Event count Synchronous output event, Input capture function
- Clock source

fosc, fs/4, fs/16, TM4IO pin input

#### Timer 5 (8-Bit free-running timer, Time base timer)

#### □ 8-Bit free-running timer

- Clock source
  - fosc, fs/4, fx, fosc/213, fx/213

#### Time base timer

- Interrupt generation cycle

fosc/27, fosc/28, fosc/29, fosc/210, fosc/213,

- fx/27, fx/28, fx/29, fx/210, fx/213
- at 32.768 kHz for low speed oscillation input

can be set to measure one minute intervals

#### Watchdog timer

- Watchdog timer frequency

fs/220

#### Remote control output

Based on the timer 0, and timer 3 output, a remote control carrier with duty cycle of 1/2 or 1/3 can be output.

Synchronous out	tput		
Timer synchronous output, Interrupt synchronous output			
	- Port 7 outputs the latched data, on the event timing of the synchronous		
	output signal of timer 1, 2, or 4, or of the external interrupt 2 (IRQ2).		
Buzzer output	Output frequency can be selected from fs/2 <sup>9</sup> , fs/2 <sup>10</sup> , fs/2 <sup>11</sup> , fs/2 <sup>12</sup> .		
Automatic transfe	er controller (ATC)		
Data	transfers between memory and peripheral function block		
	- Maximum 256 times of 1 byte transfer		
	- Activation factors		
	External interrupt IRQ0, External interrupt IRQ1, Timer 2 interrupt,		
	Timer 4 interrupt, Serial interface 0 interrupt, Serial interface 1 interrupt,		
	Serial interface 2 interrupt, A/D converter interrupt		
A/D converter	10 bits X 8 channels input		
Serial interface	3 types		
	Serial interface 0 ( Half-duplex UART / Synchronous serial interface )		
	Synchronous serial interface		
	- Transfer clock source		
	fs/2, fs/4, fs/16, UART baud rate timer ( timer 3 ) output,		
	External clock		
	<ul> <li>MSB/LSB can be selected as the first bit to be transferred.</li> </ul>		
	Any transfer size from 1 to 8 bits can be selected.		
	Half-duplex UART (Baud rate timer : Timer 3)		
	- Parity check, overrun error, framing error detection		
	- Transfer size 7 to 8 bits can be selected.		
	- When using timer 3, the transfer rate for a 12 MHz		
	oscillation are 19200/9600/4800/2400/1200/300 bps.		
	Serial interface 1 ( Synchronous serial interface )		
	- Transfer clock source		
	fs/2, fs/8, fs/64, Timer 3 output, External clock		
	- MSB/LSB can be selected as the first bit to be transferred. Any		
	transfer size 1 to 8 bits can be selected.		
	Serial interface 2 ( Single master IIC / Synchronous serial interface )		
	Synchronous serial interface		
	- Transfer clock source		
	fs/4, fs/8, fs/16, fs/32, timer 0 output divided by 4, external clock		
	<ul> <li>MSB/LSB can be selected as the first bit to be transferred.</li> </ul>		
	Any transfer size from 1 to 8 bits can be selected.		

### □ Single master IIC

- IIC communication for single master

[Note] When Matsushita standard serial interface writer is used for Flash Memory built-in version, select the serial interface 2 for the program transfer serial.

LED driver	8 pins						
Port	I/O ports	<b>57</b> pins *4					
	- LED ( large current ) driver pins	8 pins					
	- Pins with dual function for external expansion mode						
		30 pins					
	Input ports	13 pins					
	- dual function for External interrupt	5 pins					
	(One pin can also be used for zero-cross input.)						
	- dual function for A/D input 8 pins						
	Special pins						
	- Analog reference voltage input pin	2 pins					
	- Operation mode input pin 1 pin						
	- Reset input pin 1						
	- Power pin	2 pins					
	- Oscillation pin	4 pins					
	*4 The MN101CF51G have 55 pins of	I/O ports.					
Package	80-pin LQFP ( 14 mm square / 0.65 mm code name : LQFP080-P-1414A	pitch)

### 1-3-3 Pin Functions

Name	No. (80 pin)	I/O	Other Function	Function	Description
Vss Vdd	14 11			Power supply pin	Supply 2.0 V to 5.5 V to VDD and 0 V to Vss.
OSC1 OSC2	13 12	Input Output		Clock input pin Clock output pin	Connect these oscillation pins to ceramic or crystal oscillators for high-frequency clock operation. If the clock is an external input, connect it to OSC1 and leave OSC2 open. The chip will not operate with an external clock when using either the STOP or SLOW modes.
XI XO	15 16	Input Output		Clock input pin Clock output pin	Connect these oscillation pins to crystal oscillators for low-frequency clock operation. If the clock is an external input, connect it to XI and leave XO open. The chip will not operate with an external clock when using the STOP mode. If these pins are not used, connect XI to Vss and leave XO open.
NRST	25	Input	P27	Reset pin [Active low]	This pin resets the chip when power is turned on, is allocated as P27 and contains an internal pull-up resistor (Typ.35 k $\Omega$ ). Setting this pin low initializes the internal state of the device. Thereafter, setting the input to high releases the reset. The hardware waits for the system clock to stabilize, then processes the reset interrupt. Also, if "0" is written to P27 and the reset is initiated by software, a low level will be output. The output has an n-channel open-drain configuration. If a capacitor is to be inserted between NRST and VDD, it is recommended that a discharge diode be placed between NRST and VDD.
P00 P01 P02 P03 P04 P05 P06	18 19 20 21 22 23 24	VO	SBO0, TXD SBI0, RXD SBT0 SBO1 SBI1 SBT1 NDK, BUZZER	VO port 0	7-Bit CMOS tri-state I/O port. Each bit can be set individually as either an input or output by the P0DIR register. A pull-up resistor for each bit can be selected individually by the P0PLU register. At reset, the input mode is selected and pull-up resistors are disabled (high impedance output).
P10 P11 P12 P13 P14	26 27 28 29 30	VO	TM0Ю, RMOUT TM1Ю TM2Ю TM3Ю TM4Ю	VO port 1	5-Bit CMOS tri-state I/O port. Each bit can be set individually as either an input or output by the P1DIR register. A pull-up resistor for each bit can be selected individually by the P1PLU register. At reset, the input mode is selected and pull-up resistors are disabled (high impedance output).

### Table 1-3-3 Pin Function Summary (1/7)

Name	No. (80 pin)	I/O	Other Function	Function	Description
P20 P21 P22 P23 P24	31 32 33 34 35	Input	IRQ0 IRQ1, ACZ IRQ2 IRQ3 IRQ4	Input port 2	5-Bit input port. A pull-up resistor for each bit can be selected individually by the P2PLU register. At reset, pull-up resistors are disabled.
P27	25	Input	NRST	Input port 2	P27 has an n-channel open-drain configuration. When "0" is written and the reset is initiated by software, a low level will be output.
P30 P31 P32 P33 P34 P35 P36 P37	36 37 38 39 40 41 42 43	VO	SBO2, SDA SBI2 SBT2, SCL	VO port 3	8-Bit CMOS tri-state I/O port. Each bit can be set individually as either an input or output by the P3DIR register. A pull-up resistor for each bit can be selected individually by the P3PLU register. At reset, the input mode is selected and pull-up resistors are disabled (high impedance output).
P40 P41 P42 P43 P44 P45 P46 P47	44 45 46 47 48 49 50 51	VO	KEY0 KEY1 KEY2 KEY3 KEY4 KEY5 KEY6 KEY7	VO port 4	8-Bit CMOS tri-state I/O port. Each bit can be set individually as either an input or output by the P4DIR register. A pull-up resistor for each bit can be selected individually by the P4PLU register. At reset, the input mode is selected and pull-up resistors are disabled (high impedance output).
P50 P51 P52 P53 P54	52 53 54 55 56	VO	NWE NRE NCS A16 A17	VO port 5	5-Bit CMOS tri-state I/O port. Each bit can be set individually as either an input or output by the P5DIR register. A pull-up resistor for each bit can be selected individually by the P5PLU register. At reset, when single chip mode is selected, the input mode is selected and pull-up resistors for P50 to P54 are disabled (high impedance output). During processor mode, NWE, NRE, NCS, A16, and A17 are set to output mode.
P60 P61 P62 P63 P64 P65 P66 P67	57 58 59 60 61 62 63 64	VO	A0 A1 A2 A3 A4 A5 A6 A7	VO port 6	8-Bit CMOS tri-state I/O port. Each bit can be set individually as either an input or output by the P6DIR register. A pull-up resistor for each bit can be selected individually by the P6PLU register. At reset, when single chip mode is selected, the input mode is selected and pull-up resistors for P60 to P67 are disabled (high impedance output). During processor mode, output mode is selected for A0 to A7.

### Table 1-3-4 Pin Function Summary (2/7)

[Note] P36 and P37 are not allocated to MN101CF51G.

Name	No. (80 pin)	I/O	Other Function	Function	Description
P70 P71 P72 P73 P74 P75 P76 P77	65 66 67 68 69 70 71 72	VO	A8, SD00 A9, SD01 A10, SD02 A11, SD03 A12, SD04 A13, SD05 A14, SD06 A15, SD07	VO port 7	<ul> <li>8-Bit CMOS tri-state I/O port.</li> <li>Each bit can be set individually as either an input or output by the P7DIR register. A pull-up or pull-down resistor for each bit can be selected individually by the P7PLUD register. However, pull-up and pull-down resistors cannot be mixed.</li> <li>This port contains a synchronous output function for external 2 interrupt, timer 1 interrupt, timer 2 interrupt and timer 4 interrupt.</li> <li>At reset, when single-chip mode is selected, the input mode is selected and pull-up resistors for P70 to P77 are disabled (high impedance output). During processor mode, A8 to A15 are set to output mode.</li> </ul>
P80 P81 P82 P83 P84 P85 P86 P87	80 79 78 77 76 75 74 73	VO	D0, LED0 D1, LED1 D2, LED2 D3, LED3 D4, LED4 D5, LED5 D6, LED6 D7, LED7	VO port 8	8-Bit CMOS tri-state I/O port. Each individual bit can be switched to an input or output by the P8DIR register. A pull-up resistor for each bit can be selected individually by the P8PLU register. When configured as outputs, these pins can drive LEDs directly. At reset, when single-chip mode is selected, the input mode is selected and pull-up resistors for P80 to P87 are disabled (high impedance output). During processor mode, D0 to D7 are set to input mode (high impedance output).
PA0 PA1 PA2 PA3 PA4 PA5 PA6 PA7	2 3 4 5 6 7 8 9	Input	AN0 AN1 AN2 AN3 AN4 AN5 AN6 AN7	Input port A	8-Bit input port. A pull-up or pull-down resistor for each bit can be selected individually by the PAPLUD resister. However, pull-up and pull-down resistors cannot be mixed. At reset, the PA0 to PA7 input mode is selected and pull- up resistors are disabled.

### Table 1-3-5 Pin Function Summary (3/7)

Name	No. (80 pin)	١⁄٥	Other Function	Function	Description
SBO0 SBO1 SBO2	18 21 36	Output	P00, TXD P03 P30, SDA	Serial interface transmission data output pins	Transmission data output pins for serial interfaces 0 to 2. The output configuration, either CMOS push-pull or n- channel open-drain can be selected. Pull-up resistors can be selected by the P0PLU register and the P3PLU register. Select output mode by the P0DIR register and the P3DIR register, and serial data output mode by serial mode register (SC0MD3, SC1MD1 and SC2MD1). These can be used as normal I/O pins when the serial interface is not used.
SBI0 SBI1 SBI2	19 22 37	Input	P01, RXD P04 P31	Serial interface received data input pins	Receive data input pins for serial interfaces 0 to 2 Pull- up resistors can be selected by the P0PLU register and P3PLU register. Select input mode by the P0DIR register and P3DIR register, and serial input mode by the serial mode register (SC0MD3, SC1MD1, SC2MD1). These can be used as normal I/O pins when the serial interface is not used.
SBT0 SBT1 SBT2	20 23 38	VO	P02 P05 P32, SCL	Serial interface clock VO pins	Clock I/O pins for serial interfaces 0 to 2. The output configuration, either CMOS push-pull or n- channel open-drain can be selected. Pull-up resistors can be selected by the POPLU register and the P3PLU register. Select clock I/O for each communication mode by the P0DIR register, the P3DIR register and serial mode register (SC0MD3, SC1MD1 and SC2MD1). These can be used as normal I/O pins when the serial interface is not used.
TXD	18	Output	SBO0, P00	UART transmission data output pin	In the serial interface in UART mode, this pin is configured as the transmission data output pin. The output configuration, either CMOS push-pull or n- channel open-drain can be selected. Pull-up resistors can be selected by the POPLU resister. Select output mode by the PODIR register, and serial data output by serial 0 mode register 3 (SC0MD3). This can be used as normal I/O pin when the serial interface is not used.
RXD	19	Input	SBI0, P01	UART received data input pin	In the serial interface in UART mode, this pis is configured as the received data input pin. Pull-up resistors can be selected by the P0PLU register. Set this pin to the input mode by the P0DIR register, and to the serial input mode by the serial 0 mode register 3 (SC0MD3). This can be used as normal I/O pin when the serial interface is not used.

Table 1-3-6	Pin Function Summary (4/7	)
-------------	---------------------------	---

Name	No. (80 pin)	I/O	Other Function	Function	Description
SCL	38	Output	SBT2, P32	IIC clock output pin	In the serial interface in IIC mode, this pin is configurated as the clock output pin. The output configuration, either CMOS push-pull or n- channel open-drain can be selected. Pull-up resistors can be selected by the P3PLU register. Select output mode by the P3DIR register, and serial clock mode by the serial 2 mode register 1 (SC2MD1). This can be used as normal I/O pin when the serial interface is not used.
SDA	36	VO	SBO2, P30	IIC transmission / reception data I/O	In the serial interface in IIC mode, this pin is configurated as the transmission / reception data VO. The output configuration, either CMOS push-pull or n- chnnel open-drain can be selected. This can be used as normal VO pin when the serial interface is not used.
TM0IO TM1IO TM2IO TM3IO	26 27 28 29	VO	P10, RMOUT P11 P12 P13	Timer VO pins	Event counter clock input pins, timer output and PWM signal output pins for 8-bit timers 0 to 3. To use these pins as event clock inputs, configure them as inputs by the P1DIR register. When the pins are used as inputs, pull-up resistors can be specified by the P1PLU register. For timer output, PWM signal output, select the special function pin by the port 1 output mode register (P1OMD) and set to the output mode by the P1DIR register. When not used for timer I/O, these can be used as normal I/O pins.
RMOUT	26	VO	P10,TM0IO	Remote control transmission signal output pin	Output pin for remote control transmission signal with a carrier signal. For remote control carrier output, select the special function pin by the port 1 output mode register (P10MD) and set to the output mode by the P1DIR register. Also, set to the remote control carrier output by the remote control carrier output control register (RMCTR). This can be used as a normal I/O pin when remote control is not used.
BUZZER	24	Output	P06, NDK	Buzzer output	Piezoelectric buzzer driver pin. The driving frequency can be selected by the DLYCTR register. Select output mode by the PODIR register and select P06 buzzer output by the DLYCTR register. When not used for buzzer output, this pin can be used as a normal <i>VO</i> pin.
TM4IO	30	VO	P14	Timer <i>V</i> O pin	Event counter clock input pin, timer output and PWM signal output pin for 16-bit timer 4. To use this pin as event clock input, configure this as input by the P1DIR register. In the input mode, pull-up resistors can be selected by the P1PLU register. For timer output, PWM signal output, select the special function pin by the port 1 output mode register (P1OMD), and set to the output mode by the P1DIR register. When not used for timer I/O, this can be used as normal I/O pin.

Table 1-3-7	Pin Function Summary (5/7)	
-------------	----------------------------	--

Name	No. (80 pin)	١⁄٥	Other Function	Function	Description
SDO0 SDO1 SDO2 SDO3 SDO4 SDO5 SDO6 SDO7	65 66 67 68 69 70 71 72	Output	P70 P71 P72 P73 P74 P75 P76 P77	Synchronous output pins	8-Bit synchronous output pins. Synchronous output for each bit can be selected individually by the synchronous output control register (SYSMD). Set to the output mode by the P7DIR register. When not used for synchronous output, these pins can be used as a normal I/O pins.
Vref+ Vref-	10 1	-		+power supply for A/D converter - power supply for A/D converter	Reference power supply pins for the A/D converter. Normally, the values of VREF+=VDD and VREF-=VSS are used.
AN0 AN1 AN2 AN3 AN4 AN5 AN6 AN7	2 3 4 5 6 7 8 9	Input	PA0 PA1 PA2 PA3 PA4 PA5 PA6 PA7	Analog input pins	Analog input pins for an 8-channel, 10-bit A/D converter. When not used for analog input, these pins can be used as normal input pins.
IRQ0 IRQ1 IRQ2 IRQ3 IRQ4	31 32 33 34 35	Input	P20 P21, ACZ P22 P23 P24	External interrupt input pins	External interrupt input pins. The valid edge for IRQ0 to 4 can be selected through the IRQnICR register. IRQ1 is an external interrupt pin that is able to deternine AC zero crossings. When these are not used for interrupts, these can be used as normal input pins.
ACZ	32	Input	P21, IRQ1	AC zero-cross detection input pin	An input pin for an AC zero-cross detection circuit. The AC zero-cross detection circuit outputs a high level when the input is at an intermediate level. Otherwise, it outputs a low level voltage all the times. ACZ input signal is connected to the P21 input circuit and the IQR1 interrupt circuit. When the AC zero-cross detection circuit is not used, this pin can be used as a normal P21 input. The selection is set by the P21IM flag of the FLOAT1 register.

### Table 1-3-8 Pin Function Summary (6/7)

\_

Name	No. (80 pin)	I/O	Other Function	Function	Description
KEY0 KEY1 KEY2 KEY3 KEY4 KEY5 KEY6 KEY7	44 45 46 47 48 49 50 51	Input	P40 P41 P42 P43 P44 P45 P46 P47	Key interrupt input pins	Input pins for interrupt based on ORed result of pin inputs. Key input pin for 2 bits can be selected individually by the key interrupt control register (P4IMD). When not used for KEY input, these pins can be used as normal I/O pins.
MMOD	17	Input		Memory mode switch input pin	This pin sets the memory expansion mode. If used with the processor mode, set the input high. For all other cases set the input low. Do not change the setup after reset.
NWE	52 53	Output Output	P50 P51	Write enable pin (Active low) Read enable pin	Memory control signals for an expanded memory space external to this LSI.
NCS	54	Output	P51	(Active low) Chip select pin (Active low)	NWE is a strobe signal that is output for writing to external memory. NRE is a strobe signal that is output for reading from external memory.
NDK	24	Input	P06, BUZZER	Data acknowledge pin (Active low)	NCS is a chip select signal that is output when external memory is accessed.
A0	57	Output	P60	Address pin	NDK is an acknowledge signal that indicates the

### 1-4 Block Diagram

### 1-4-1 Block Diagram

\* Differs depending upon the model. [ CP Table 1-1-1 Product Summary]

Figure 1-4-1 Block Diagram

### **1-5** Electrical Characteristics

This LSI user's manual describes the standard specification. System clock (fs) is : 1/2 of high speed oscillation at NOR-MAL mode, or 1/4 of low speed oscillation at SLOW mode. Please ask our sales offices for its own product specifications.

Contents Model	MN101C51F series	
Structure	CMOS integrated circuit	
Application	General purpose	
Function	8-Bit single-chip microcontroller	

### 1-5-1 Absolute Maximum Ratings<sup>\*2,\*3</sup> (voltages referenced to Vss)

No.	Pa	rameter	Symbol	Rating	Unit	
1	Power supply	voltage	Vdd	- 0.3 to +7.0	V	
2	Input clamp c	urrent (ACZ)	IC	- 500 to +500	μA	
3	Input pin volta	ge	VI	- 0.3 to VDD +0.3		
4	Output pin vol	tage	Vo	- 0.3 to VDD +0.3	V	
5	I/O pin voltage	9	VIO1	- 0.3 to VDD +0.3		
6	Peak output current	Port 8	loL1 (peak)	30		
7		Other than port 8	lol2 (peak)	20		
8		All pins	Юн (peak)	- 10	mA	
9	Average output current *1	Port 8	lol1 (avg)	20		
10		Other than port 8	lOL2 (avg)	15		
11		All pins IOH (avg)		- 5		
12	Power dissipa	ation	PD	400	mW	
13	Operating am	bient temperature	Topr	- 40 to +85	°℃	
14	Storage temp	erature	Tstg	- 55 to +125	-U	

\*1 Applied to any 100 ms period.

\*2 Connect at least one bypass capacitor of 0.1 μF or larger between the power supply pin and the ground for latch-up prevention.

\*3 The absolute maximum ratings are the limit values beyond which the LSI may be damaged and proper operation is not assured.

#### **Operating Conditions** [ NORMAL mode : fs=fosc/2, SLOW mode : fs=fx/4 ] 1-5-2

Parameter		Ourseland I	Quaditiana	Rating			11-14
		Symbol	Conditions	MIN	TYP	MAX	Unit

\*1 There should be more than 2 V between VREF+ and VREF-.

### **1-5-5** Bus Timing (0 wait states) during Memory Expansion

When the address pin and the data pin are high-impedance, the through current is generated at the CMOS input of the address output pin and the data output pin. Also, the through current can be generated at the input pin of the external memory (inc. ASIC, etc.). To prevent the through current, add the pull-up / pull-down resistor or the level holding circuit to the expansion bus line (address + data) to fix the level of the expansion bus line. (Especially for stand-by mode.)

# 1-6 Package Dimension

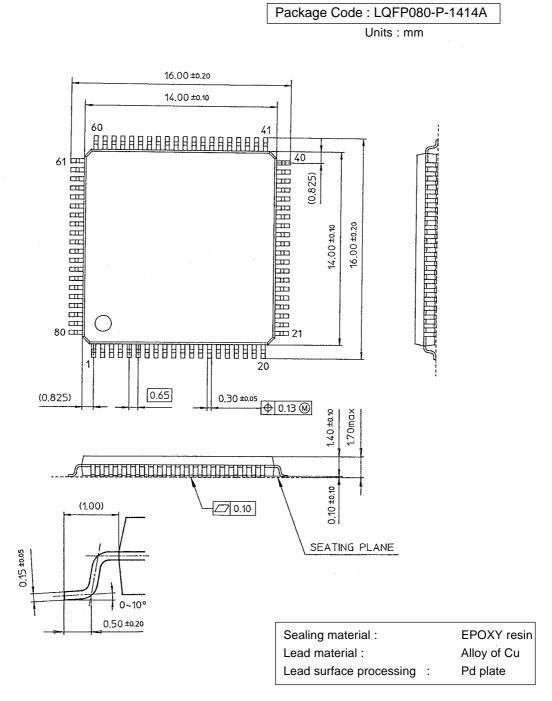

Figure 1-6-1 80-Pin LQFP

The package dimension is subjected to change. Before using this product, please obtain product specifications from the sales office.

# **1-7** Precautions

### 1-7-1 General Usage

■Connection of VDD pin, and Vss pin

All VDD pins should be connected directly to the power supply and all VSS pins should be connected to ground in the external. Please consider the LSI chip orientation before mounting it on to the printed circuit board. Incorrect connection may lead a fusion and break a micro controller.

#### ■Cautions for Operation

- (1) If you install the product close to high-field emissions (under the cathode ray tube, etc), shield the package surface to ensure normal performance.
- (2) Each model has different operating condition,
  - Operation temperature should be well considered. For example, if temperature is over the operating condition, its operation may be executed wrongly.
  - Operation voltage should be also well considered. If the operation voltage is over the operation range, it can be shortened the length of its life. If the operation voltage is below the operating range, it operation may be wrong.

### 1-7-2 Unused Pins

Unused Pins (only for output)

Set unused pins (only for output) open.

Figure 1-7-1 Unused Pins (only for output)

■Unused Pins (only for input)

Insert 10 k $\Omega$  to 100 k $\Omega$  resistor to unused pins (only for input) for pull-up or pull-down. If the input is unstable, Pch transistor and Nch transistor of input inverter are on, and through current goes to the input circuit. That increases current consumption and causes power supply noise.

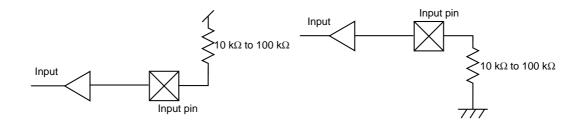

Figure 1-7-2 Unused Pins (only for input)

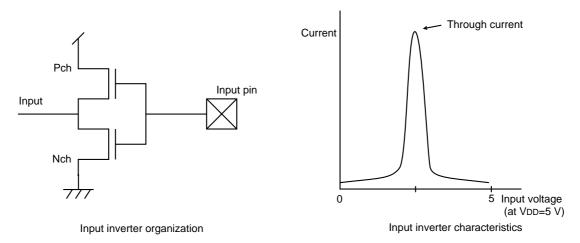

Figure 1-7-3 Input Inverter Organization and Characteristics

#### ■Unused pins (for I/O)

Unused I/O pins should be set according to pins' condition at reset. If the output is high impedance (Pch / Nch transistor : output off) at reset, to stabilize input, set 10 k $\Omega$  to 100 k $\Omega$  resistor to be pull-up or pull-down. If the output is on at reset, set them open.

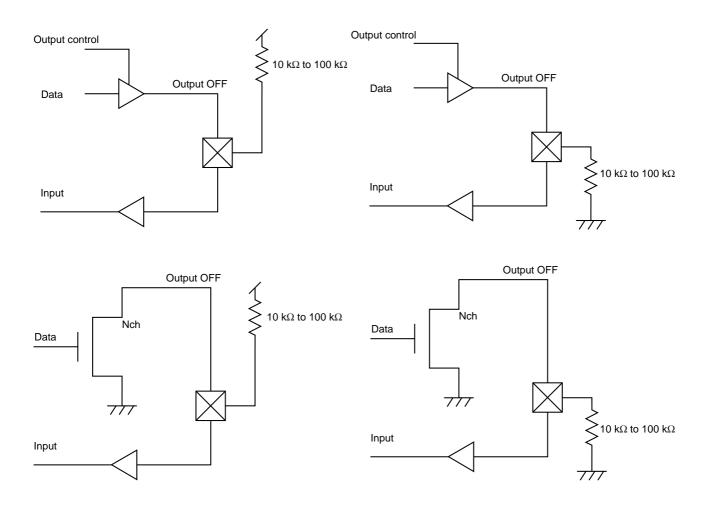

Figure 1-7-4 Unused I/O pins (high impedance output at reset)

### 1-7-3 Power Supply

■The Relation between Power Supply and Input Pin Voltage

Input pin voltage should be supplied only after power supply is on. If the input pin voltage is applied before power supply is on, a latch up occurs and causes the destruction of micro controller by a large current flow.

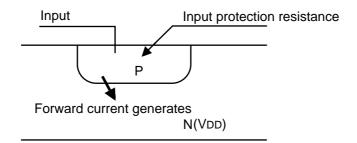

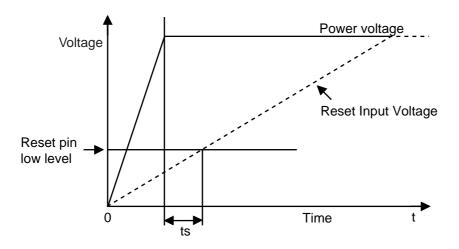

Figure 1-7-5 Power Supply and Input Pin Voltage

■The Relation between Power Supply and Reset Input Voltage

After power supply is on, reset pin voltage should be low for sufficient time, ts, before rising, in order to be recognized as a reset signal.

Figure 1-7-6 Power Supply and Reset Input Voltage

### 1-7-4 Power Supply Circuit

#### ■Cautions for Setting Circuits with VDD

The CMOS logic microcontroller is high speed and high density. So, the power circuit should be designed, taking into consideration of AC line noise, ripple caused by LED driver. Figure 1-8-6 shows an example for emitter follower type power supply circuit.

■An Example for Emitter Follower Type Power Supply Circuit

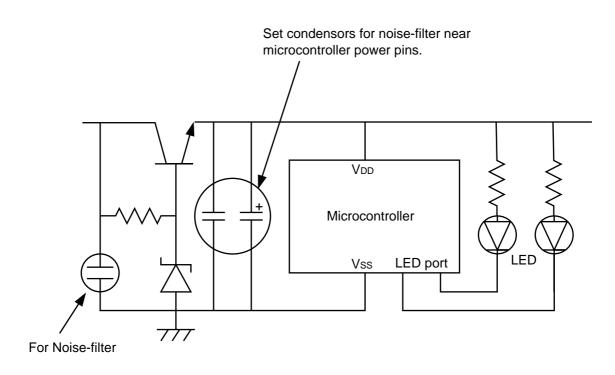

Figure 1-7-7 An Example for Emitter Follower Type Power Supply Circuit

2

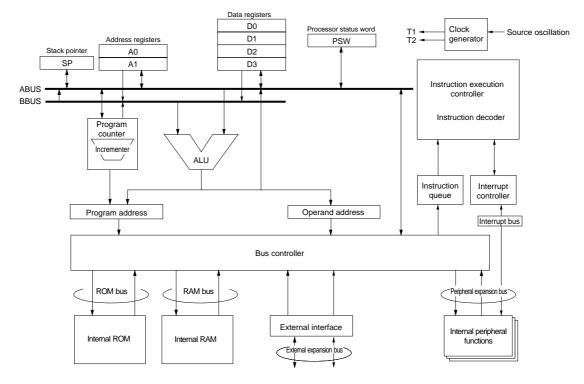

# 2-1 Overview

The MN101C CPU has a flexible optimized hardware configuration. It is a high speed CPU with a simple and efficient instruction set. Specific features are as follows:

- Minimized code sizes with instruction lengths based on 4-bit increments
   The series keeps code sizes down by adopting a minimum instruction length of one byte and
   variable instruction lengths based on 4-bit increments.
- 2. Minimum instruction execution time is one system clock cycle.
- 3. Minimized register set that simplifies the architecture and supports C language The instruction set has been determined, depending on the size and capacity of hardware, after an analysis of embedded application programing code and creation code by C language compiler. Therefore, the set is simple instruction using the minimal register set required for C language compiler. [ ] "MN101C LSI User's Manual" (Architecture Instructions) ]

Structure	Load / store architecture					
	Six registers	Data : 8-bit x 4 Address : 16-bit x 2

Table 2-1-1 Basic Specifications

## 2-1-1 Block Diagram

Clock generator	Uses a clock oscillator circuit driven by an external crystal or ceramic resonator to supply clock signals to CPU blocks.
Program counter	Generates addresses for the instructions to be inserted into the instruction queue. Normally incremented by sequencer indication, but may be set to branch destination address or ALU operation result when branch instructions or interrupts occur.
Instruction queue	Stores up to 2 bytes of pre-fetched instructions.
Instruction decoder	Decodes the instruction queue, sequentially generates the control signals needed for instruction execution, and executes the instruction by controlling the blocks within the chip.
Instruction execution controller	Controls CPU block operations in response to the result decoded by the instruction decoder and interrupt requests.
ALU	Executes arithmetic operations, logic operations, shift operations, and calculates operand addresses for register relative indirect addressing mode.
Internal ROM, RAM	Assigned to the execution program, data and stack region.
Address register	Stores the addresses specifying memory for data transfer. Stores the base address for register relative indirect addressing mode.
Data register	Holds data for operations. Two 8-bit registers can be connected to form a 16-bit register.
Interrupt controller	Detects interrupt requests from peripheral functions and requests CPU shift to interrupt processing.
Bus controller	Controls connection of CPU internal bus and CPU external bus.
Internal peripheral functions	Includes peripheral functions (timer, serial interface, A/D converter, etc.). Peripheral functions vary with model.

## 2-1-2 CPU Control Registers

This LSI locates the peripheral circuit registers in memory space (x'03F00' to x'03FFF') with memorymapped I/O. CPU control registers are also located in this memory space.

Registers	Address	R/W	Function	Pages
CPUM	x'03F00'	R/W *1	CPU mode control register	II - 25
MEMCTR	x'03F01'	R/W	Memory control register	II - 18
Reserved	x'03FE0'	-	For debugger	-
NMICR	x'03FE1'	R/W	Non maskable interrupt control register	III - 16
xxxlCR	x'03FE2'   x'03FFE'	R/W	Maskable interrupt control register	III - 17 to 33
Reserved	x'03FFF'	-	Reserved (For reading interrupt vector data on interrupt process)	-

#### Table 2-1-2 CPU Control Registers

\*1 Part of the register is only readable

### 2-1-3 Instruction Execution Controller

The instruction execution controller consists of four blocks: memory, instruction queue, instruction registers, and instruction decoder.

Instructions are fetched in 1-byte units, and temporarily stored in the 2-byte instruction queue. Transfer is made in 1-byte or half-byte units from the instruction queue to the instruction register to be decoded by the instruction decoder.

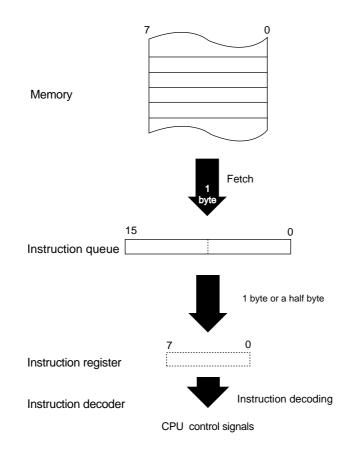

Figure 2-1-2 Instruction Execution Controller Configuration

### 2-1-4 Pipeline Process

Pipeline process means that reading and decoding are executed at the same time on different instructions, then instructions are executed without stopping. Pipeline process makes instruction execution continual and speedy. This process is executed with instruction queue and instruction decoder.

Instruction queue is buffer that fetches the second instruction in advance. That is controlled to fetch the next instruction when instruction queue is empty at each cycle on execution. At the last cycle of instruction execution, the first word (operation code) of executed instruction is stored to instruction register. At that time, the next operand or operation code is fetched to instruction queue, so that the next instruction can be executed immediately, even if register direct (da) or immediate (imm) is needed at the first cycle of the next instruction. But on some other instruction such as branch instruction, instruction queue becomes empty on the time that the next operation code to be executed is stored to instruction register at the last cycle. Therefore, only when instruction queue is empty, and direct address (da) or immediate data (imm) are needed, instruction queue keeps waiting for a cycle.

Instruction queue is controlled automatically by hardware so that there is no need to be controlled by software. But when instruction execution time is estimated, operation of instruction queue should be into consideration. Instruction decoder generates control signal at each cycle of instruction execution by micro program control. Instruction decoder uses pipeline process to decode instruction queue at one cycle before control signal is needed.

### 2-1-5 Registers for Address

Registers for address include program counter (PC), address registers (A0, A1), and stack pointer (SP).

#### ■Program Counter (PC)

This register gives the address of the currently executing instruction. It is 19 bits wide to provide access to a 256 KB address space in half byte (4-bit increments). The LSB of the program counter is used to indicate half byte instruction. The program counter after reset is stored from the value of vector table at the address of 4000.

#### ■Address Registers (A0, A1)

These registers are used as address pointers specifying data locations in memory. They support the operations involved in address calculations (i.e. addition, subtraction and comparison). Those pointers are 2 bytes data. Transfers between these registers and memory are always in 16-bit units. Either odd or even address can be transferred. At reset, the value of address register is undefined.

#### ■Stack Pointer (SP)

This register gives the address of the byte at the top of the stack. It is decremented during push operations and incremented during pop operations. At reset, the value of SP is undefined.

### 2-1-6 Registers for Data

Registers for data include four data registers (D0, D1, D2, D3).

■Data Registers (D0, D1, D2, D3)

Data registers D0 to D3 are 8-bit general-purpose registers that support all arithmetic, logical and shift operations. All registers can be used for data transfers with memory.

The four data registers may be paired to form the 16-bit data registers DW0 (D0+D1) and DW1 (D2+D3). At reset, the value of Dn is undefined.

1	5 8	7	0
Data	D1	D0	DW0
registers	D3	D2	DW1

### 2-1-7 Processor Status Word

Processor status word (PSW) is an 8-bit register that stores flags for operation results, interrupt mask level, and maskable interrupt enable. PSW is automatically pushed onto the stack when an interrupt occurs and is automatically popped when return from the interrupt service routine.

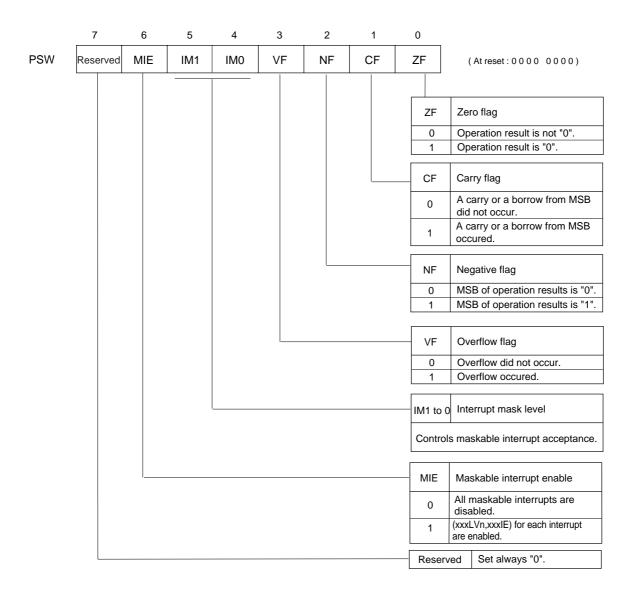

Figure 2-1-3 Processor Status Word (PSW)

#### ■Zero Flag (ZF)

Zero flag (ZF) is set to "1", when all bits are '0' in the operation result. Otherwise, zero flag is cleared to "0".

#### ■Carry Flag (CF)

Carry flag (CF) is set to "1", when a carry from or a borrow to the MSB occurs. Carry flag is cleared to "0", when no carry or borrow occurs.

#### ■Negative Flag (NF)

Negative flag (NF) is set to "1" when MSB is '1' and reset to "0" when MSB is '0'. Negative flag is used to handle a signed value.

#### ■Overflow Flag (VF)

Overflow flag (VF) is set to "1", when the arithmetic operation results overflow as a signed value. Otherwise, overflow flag is cleared to "0".

Overflow flag is used to handle a signed value.

#### ■Interrupt Mask Level (IM1 and IM0)

Interrupt mask level (IM1 and IM0) controls the maskable interrupt acceptance in accordance with the interrupt factor interrupt priority for the interrupt control circuit in the CPU. The two-bit control flag defines levels '0' to '3'. Level 0 is the highest mask level. The interrupt request will be accepted only when the level set in the interrupt level flag (xxxLVn) of the interrupt control register (xxxICR) is higher than the interrupt mask level. When the interrupt is accepted, the level is reset to IM1-IM0, and interrupts whose mask levels are the same or lower are rejected during the accepted interrupt processing.

	Interrupt r	nask level	Drignity	Acceptable interrupt levels	
	IM1	IMO	Priority		
Mask level 0	0 0		High	Non-maskable interrupt (NMI) only	
Mask level 1	0 1			NMI, Level 0	
Mask level 2	1	0		NMI, Level 0 to 1	
Mask level 3	1 1		Low	NMI, Level 0 to 2	

Table 2-1-3 Interrupt Mask Level and Interrupt Acceptance

#### ■Maskable Interrupt Enable (MIE)

Maskable interrupt enable flag (MIE) enables/disables acceptance of maskable interrupts by the CPU's internal interrupt acceptance circuit. A '1' enables maskable interrupts; a '0' disables all maskable interrupts regardless of the interrupt mask level (IM1-IM0) setting in PSW. This flag is not changed by interrupts.

Overview II - 9

### 2-1-8 Addressing Modes

This LSI supports the nine addressing modes.

Each instruction uses a combination of the following addressing modes.

- 1) Register direct
- 2) Immediate
- 3) Register indirect
- 4) Register relative indirect
- 5) Stack relative indirect
- 6) Absolute
- 7) RAM short
- 8) I/O short
- 9) Handy

These addressing modes are well-suited for C language compilers. All of the addressing modes can be used for data transfer instructions. In modes that allow half-byte addressing, the relative value can be specified in half-byte (4-bit) increments, so that instruction length can be shorter. Handy addressing reuses the last memory address accessed and is only available with the MOV and MOVW instructions. Combining handy addressing with absolute addressing reduces code size. For transfer data between memory, 7 addressing modes ; register indirect, register relative indirect, stack relative indirect, absolute, RAM short, I/O short, handy can be used. For operation instruction, register direct and immediate can be used. Refer to instruction's manual for the MN101C series.

This LSI is designed for 8-bit data access. It is possible to transfer data in 16-bit increments with odd or even addresses.

Addressi	ng mode	Effective address	Explanation			
Register direct	Dn/DWn An/SP PSW	-	Directly specifies the register. Only interna registers can be specified.			
Immediate	imm4/imm8 imm16	-	Directly specifies the operand or mask value appended to the instruction code.			
Register indirect	(An)	15 0 An	Specifies the address using an address register.			
	(d8, An)	15 0 An+d8	Specifies the address using an address register with 8-bit displacement.			
Register relative	(d16, An)	15 0 An+d16	Specifies the address using an address register with 16-bit displacement.			
indirect	(d4, PC) (branch instructions only)	17 0 H PC+d4 1 * 1	Specifies the address using the program counter with 4-bit displacement and H bit.			
	(d7, PC) (branch instructions only)	17 0 H PC+d7 1 *1	Specifies the address using the program counter with 7-bit displacement and H bit.			
	(d11, PC) (branch instructions only)	17 0 H PC+d11 1 * 1	Specifies the address using the program counter with 11-bit displacement and H bit			
	(d12, PC) (branch instructions only)	17 0 H PC+d12 1 *1	Specifies the address using the program counter with 12-bit displacement and H bit			
	(d16, PC) (branch instructions only)	17 0 H PC+d16 1 *1	Specifies the address using the program counter with 16-bit displacement and H bit			
Stack relative	(d4, SP)	15 0 SP+d4	Specifies the address using the stack pointer with 4-bit displacement.			
indirect	(d8, SP)	15 0 SP+d8	Specifies the address using the stack pointer with 8-bit displacement.			
	(d16, SP)	15 0 SP+d16	Specifies the address using the stack pointer with 16-bit displacement.			
Absolute	(abs8)	7 0 abs8				
	(abs12)	11 0 abs12	Specifies the address using the operand value appended to the instruction code. Optimum operand length can be used to			
	(abs16)	15 0 abs16	specify the address.			
	(abs18)	17 0 H abs18 * 1				
RAM short	(branch instructions only) (abs8)	7 0 abs8	Specifies an 8-bit offset from the address x'00000'.			
I/O short	(io8)	15 0 IOTOP+io8	Specifies an 8-bit offset from the top address (x'03F00') of the special function register are:			
Handy	(HA)	-	Reuses the last memory address accesse and is only available with the MOV and MOVW instructions. Combined use with absolute addressing reduces code size.			

#### Table 2-1-4 Addressing Modes

\* 1 H: half-byte bit

# 2-2 Memory Space

### 2-2-1 Memory Mode

ROM is the read only area and RAM is the memory area which contains readable/writable data. In addition to these, peripheral resources such as memory-mapped special registers are allocated. The MN101C series supports three memory modes (single chip mode, memory expansion mode, processor mode) in its memory model. Setting of each mode is different.

In single chip mode, the system consists of only internal memory. In memory expansion mode, and processor mode, ROM, RAM and external device for operation can be connected.

Settings for each modes are as follows ;

Memory mode	MMOD pin	EXMEM flag in (MEMCTR register)	EXADV3 to 1 flag in (EXADV register)		
Single chip mode	L	0	-		
Memory expansion mode	L	1	0/1		
Processor mode	Н	-	-		

Table 2-2-1	Memory Mode Setup
-------------	-------------------

MMOD pin should be fixed to "L" level, or "H" level. Do not change the setup of MMOD pin after reset.

### 2-2-2 Single-chip Mode

In single-chip mode, the system consists of only internal memory. This is the optimized memory mode and allows construction of systems with the highest performance.

The single-chip mode uses only internal ROM and internal RAM. The MN101C series devices offer up to 12 KB of RAM and up to 224 KB of ROM.

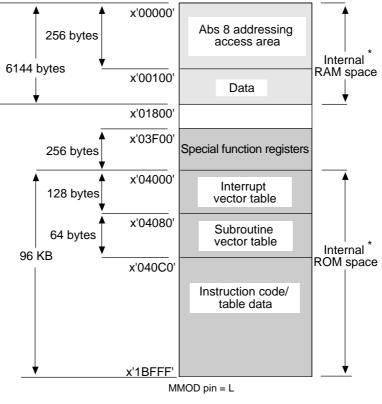

Figure 2-2-1 Single-chip Mode

\* Differs depending upon the model.

[ C Table 2-2-2. Internal ROM / Internal RAM ]

 Table 2-2-2
 Internal ROM / Internal RAM

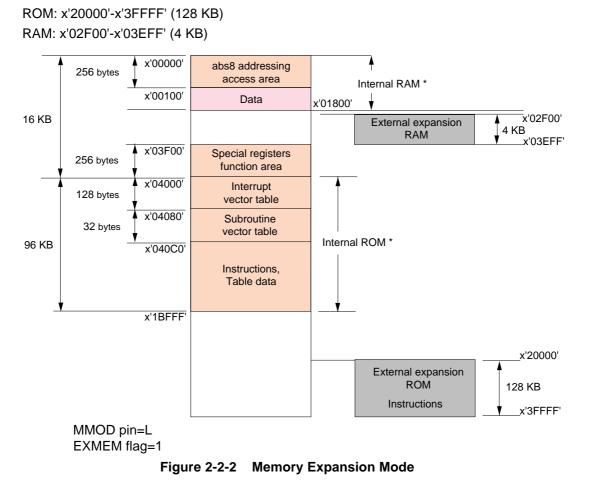

Model	Internal RAI	И	Internal ROM			
Moder	Address	bytes	Address	bytes		
MN101C51F	X'00000' to X'017FF'	6144	X'04000' to X'1BFFF'	96 K		
MN101CF51G	X'00000' to X'027FF'	10240	X'04000' to X'23FFF'	128 K		
MN101CP28L	X'00000' to X'027FF'	10240	X'04000' to X'1BFFF'	96 K		

\* Note that x'1BFFF' of the MN101CP28 is reserved for ROM option.

### 2-2-3 Memory Expansion Mode

The MN101C series can connect external ROM, RAM and external devices for operation in memory expansion mode. This is the mode to expand to external memory while using internal ROM and RAM.

The memory expansion mode is set by assigning EXMEM flag (bp4) of the memory control register (MEMCTR), on single chip mode. The pins A8 to A 17 of the address expansion control register (EXADV) control the address output to pins by setting the bit 7 to bit 5 of the EXADV. Memory areas can be externally expanded as follows :

\* Differs depending upon the model.

[ C Table 2-2-2. Internal ROM / Internal RAM ]

### 2-2-4 Processor Mode

This mode accesses the external expansion ROM and RAM, ignoring any internal ROM present.

For processor mode, set the MMOD pin to high. Memory areas can be externally expanded as follows:

ROM: x'04000'-x'3FFFF' (240 KB) RAM: x'02F00'-x'03EFF' (4 KB)

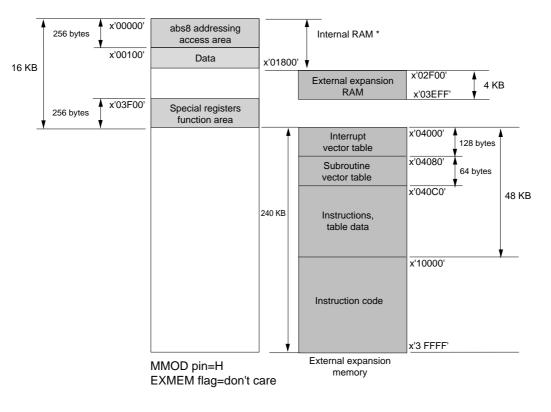

Figure 2-2-3 Processor Mode

\* Differs depending upon the model.

# 2-2-5 Special Function Registers

The MN101C series locates the special function registers (I/O spaces) at the addresses x'03F00' to x'03FFF' in memory space. The special function registers of this LSI are located as shown below.

ſ	ē		0	ports

Table 2-2-3 Register Map

# 2-3 Bus Interface

### 2-3-1 Bus Controller

The MN101C series provides separate buses to the internal memory and internal peripheral circuits to reduce bus line loads. Therefore, this series realizes faster operation.

There are four such buses: ROM bus, RAM bus, peripheral expansion bus (I/O bus), and external expansion bus. They connect to the internal ROM, internal RAM, internal peripheral circuits, and external interfaces respectively. The bus control block controls the parallel operation of instruction read and data access, the access speed adjustment for low-speed external devices. A functional block diagram of the bus controller is given below.

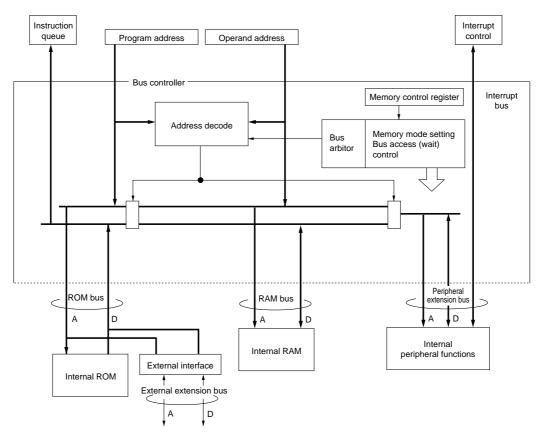

Figure 2-3-1 Functional Block Diagram of the Bus Controller

In memory expansion mode or processor mode, the external expansion bus can access external device. Memory control register (MEMCTR) can be used to select the access mode, fixed wait cycle mode or handshake mode. Wait cycle setting to peripheral expansion bus, connected to internal peripheral circuits is available.

## 2-3-2 Control Registers

Bus interface is controlled by 2 registers : the memory control register (MEMCTR) and the expansion address control register (EXADV).

Memory Control Register (MEMCTR)

	7	6	5	4	3	2	1	0					
MEMCTR	IOW1	IOW0	IVBA	EXMEM	EXWH	IRWE	EXW1	EXW0	(At reset : 1 1 0 0 1 0 1 1 )				
		I		· I			·		-				
									EXW1 to 0	Fixed wait cycles	Bus cycle at 20 MHz oscillation		
									0 0	No wait cycles	100 ns		
									0 1	1 wait cycle	150 ns		
									1 0	2 wait cycles	200 ns		
									11	3 wait cycles	250 ns		
									IRWE	Software write enable flag for	· interrupt request		
									0	Software write disable Even if data is written to ead register (xxxICR), the state request flag (xxxIR) will not	of the interrupt		
									1	Software write enable			
									EXWH	Fixed wait cycle mode or ha	andshake mode		
									0	Handshake mode			
									1	Fixed wait cycle mode			
									EXMEM	Memory expansion mode			
									0	Do not expand external me	mory		
									1	Expand external memory			
									IVBA	Base address setting for inte	errupt vector table		
									0	Interrupt vector base = x'04	000'		
									1	Interrupt vector base = x'00	100'		
									IOW1 to 0	Wait cycles when accessing special register area	Bus cycle at 20 MHz oscillation		
									0 0	No wait cycles	100 ns		
									0 1	1 wait cycle	150 ns		
									10	2 wait cycles	200 ns		
									11	3 wait cycles	250 ns		

Figure 2-3-2 Memory Control Register (MEMCTR: x'3F01' R/W)

The EXW1-EXW0 wait settings affect accesses to external devices in the processor mode and memory expansion mode. After reset, MEMCTR specifies the fixed wait cycle mode with three wait cycles.

The IOW1-IOW0 wait settings affect accesses to the special registers located at the addresses x'3F00'-x'3FFF'. After reset, MEMCTR specifies the fixed wait cycle mode with three wait cycles. Wait setting of IOW is a function, which CPU supports for special use, for example, when special function register or I/O is expanded to external. For this LSI, wait cycle setting is not always necessary. Select "no-wait cycle" for high performance system construction.

#### ■Expansion Address Control Register (EXADV)

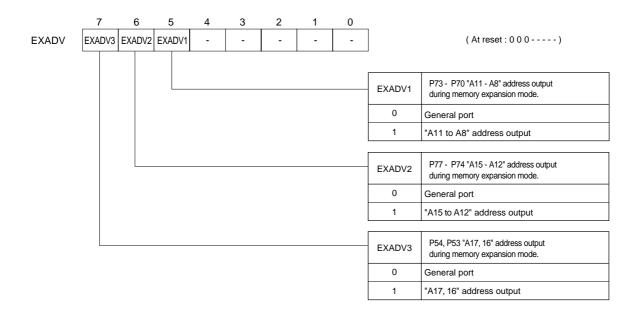

Figure 2-3-3 Expansion Address Control Register (EXADV : x'03F0E', R/W)

### 2-3-3 Fixed Wait Cycle Mode

This mode accesses ROM, RAM, or other low-speed devices connected to the external expansion bus by inserting the number of wait cycles specified in the external fixed wait counter (EXW) field of the memory control register (MEMCTR).

Fixed wait cycle mode is used to automatically insert the number of wait cycles specified by the fixed wait counter (EXWn) in the MEMCTR. After reset, MEMCTR specifies the fixed wait cycle to three wait cycles. To change to handshake mode or to use a different number, modify the appropriate bits in MEMCTR.

### 2-3-4 Handshake Mode

Handshake mode uses the interlock control method in the data transfer sequence , with a transfer enable signals (NRE, NWE) and a data acknowledge signal (NDK).

On handshake mode, watchdog timer can be used to detect NDK not received error. The reception of NDK is waited until the non-maskable interrupt is generated by the overflow of watchdog timer.

#### Access Timing with No Wait Cycles

The NRE or NWE timing is determined based on OSC2. However, since the delay from OSC2 to RE or WE varies depending upon the product, use NRE or NWE as the reference when synchronizing with other devices. Operation timing is same as the timing at NORMAL mode (OSC high oscillation selection).

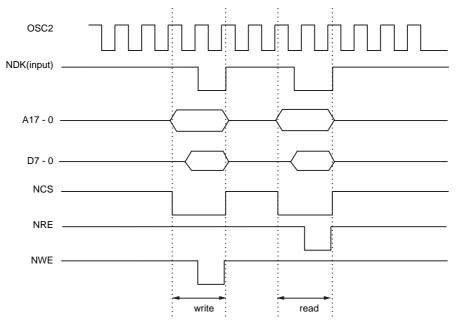

Figure 2-3-4 ROM and RAM Access Timing with No Wait Cycles

#### ■Access Timing with 1 Wait Cycle

Access timing with 2 or 3 wait cycles follows the same pattern. The latter part of the cycle is extended and the timing is the same.

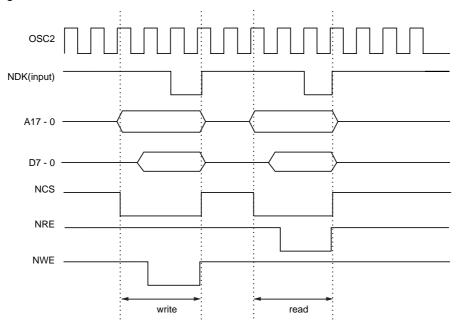

Figure 2-3-5 ROM and RAM Access Timing with 1 Wait Cycle

# 2-3-5 External Memory Connection Example

#### ■SRAM Connection Example

This example shows connection to SRAM.

The external expansion RAM area is x'02F00' to x'03EFF'.

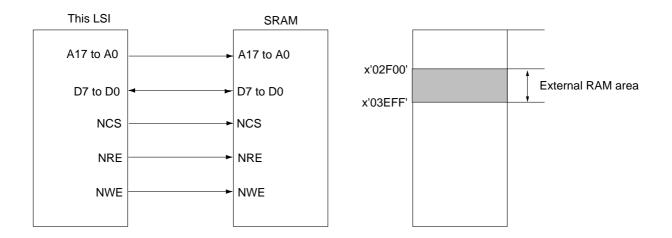

Figure 2-3-7 SRAM Connection Example

# 2-4 Standby Function

### 2-4-1 Overview

This LSI has two sets of system clock oscillator (high speed oscillation, low speed oscillation) for two CPU operating modes (NORMAL and SLOW), each with two standby modes (HALT and STOP). Power consumption can be decreased with using those modes.

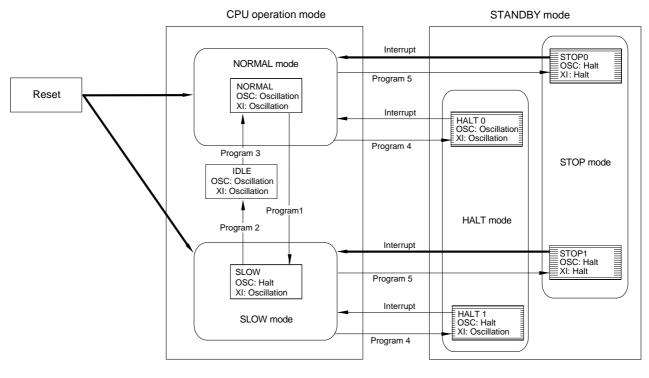

Figure 2-4-1 Transition Between Operation Modes

- ■HALT Modes (HALT0, HALT1)
- The CPU stops operating. But both of the oscillators remain operational in HALT0 and only the highfrequency oscillator stops operating in HALT1.
- An interrupt returns the CPU to the previous CPU operating mode that is, to NORMAL from HALT0 or to SLOW from HALT1.
- ■STOP Modes (STOP0, STOP1)
- The CPU and both of the oscillators stop operating.
- An interrupt restarts the oscillators and, after allowing time for them to stabilize, returns the CPU to the previous CPU operating mode - that is, to NORMAL from STOP0 or to SLOW from STOP1.

#### ■SLOW Mode

 This mode executes the software using the low-frequency clock. Since the high-frequency oscillator is turned off, the device consumes less power while executing the software.

#### ■IDLE Mode

 This mode allows time for the high-frequency oscillator to stabilize when the software is changing from SLOW to NORMAL mode.

To reduce power dissipation in STOP and HALT modes, it is necessary to check the stability of both the output current from pins and port level of input pins. For output pins, the output level should match the external level or direction control should be changed to input mode. For input pins, the external level should be fixed.

The MN101C30 series has two system clock oscillation circuits. OSC is for high-frequency operation (NORMAL mode) and XI is for low-frequency operation (SLOW mode). Transition between NORMAL and SLOW modes or to standby mode is controlled by the CPU mode control register (CPUM). Reset and interrupts are the return factors from standby mode. A wait period is inserted for oscillation stabilization at reset and when returning from STOP mode, but not when returning from HALT mode. High/low-frequency oscillation mode is automatically returned to the same state as existed before entering standby mode.

To stabilize the synchronization at the moment of switching clock speed between high speed oscillation (fosc) and low speed oscillation (fx), fosc should be set to 2.5 times or higher frequency than fx.

# 2-4-2 CPU Mode Control Register

7 2 6 5 4 3 1 0 RESERVED RESERVED STOP HALT OSC1 OSC0 CPUM \_ 0 0 0 At reset : 0 0 0 0 Set always "0". Status Operation OSC1 System STOP HALT OSC1 OSC0 XI/XO CPU /OSC2 clock (fs) mode NORMAL 0 0 0 0 Oscillation Oscillation Operating fosc/2 IDLE 0 0 0 1 Operating Oscillation Oscillation fx/4 SLOW 0 0 1 1 Halt Oscillation fx/4 Operating HALT0 0 1 0 0 Oscillation Oscillation fosc/2 Halt HALT1 Oscillation Halt 0 1 1 1 Halt fx/4 STOP0 0 1 0 0 Halt Halt Halt Halt STOP1 1 0 1 1 Halt Halt Halt Halt

Transition from one mode to another mode is controlled by the CPU mode control register (CPUM).

#### Figure 2-4-2 Operating Mode and Clock Oscillation (CPUM : x'3F00', R/W)

The procedure for transition from NORMAL to HALT or STOP mode is given below.

- (1) If the return factor is a maskable interrupt, set the MIE flag in the PSW to "1" and set the interrupt mask (IM) to a level permitting acceptance of the interrupt.
- (2) Clear the interrupt request flag (xxxIR) in the maskable interrupt control register (xxxICR), set the interrupt enable flag (xxxIE) for the return factor, and set the IE flag in the PSW.
- (3) Set CPUM to HALT or STOP mode.

Set the IRWE flag of the memory control register (MEMCTR) to clear interrupt request flag by software.

The system clock (fs) is fosc/2 at NORMAL mode, and fx/4 at SLOW mode.

### 2-4-3 Transition between SLOW and NORMAL

This LSI has two CPU operating modes, NORMAL and SLOW. Transition from SLOW to NORMAL requires passing through IDLE mode.

A sample program for transition from NORMAL to SLOW mode is given below.

Program 1		
MOV	x'3', D0	; Set SLOW mode.
MOV	D0, (CPUM)	

Transition from NORMAL to SLOW mode, when the low-frequency clock has fully stabilized, can be done by writing to the CPU mode control register. In this case, transition through IDLE is not necessary.

For transition from SLOW to NORMAL mode, the program must maintain the idle state until high-frequency clock oscillation is fully stable. In IDLE mode, the CPU operates on the low-frequency clock.

For transition from SLOW to NORMAL, oscillation stabilization waiting time is required same as that after reset. Software must count that time.

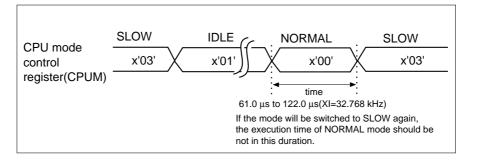

We recommend selecting the oscillation stabilization time after consulting with oscillator manufacturers.

Sample program for transition from SLOW to NORMAL mode is given below.

	; A loop to keep approx. 6.7 ms with low-frequency clock (32 kHz)
ADD -1, D0 BNE LOOP BUB D0, D0	; operation when changed to high-frequency clock (20 MHz). ; set NORMAL mode.
/  \  	NE LOOP

Refer the following cautions to initiate the program on the transition to SLOW mode in case where the execution time at NORMAL mode is too short.

After the transition to NORMAL mode from SLOW mode, if the mode is returned to SLOW again during 2 to 4 cycles of the low speed oscillation clock, the short pulse can be generated in the system of the clock causing errors.

The following (1) or (2) should be executed on the program by the software.

(1) When the execution time at NORMAL is above that duration.

The following program should be inserted to make the waiting time for more than 4 cycles of low speed oscillation clock, before the transition from NORMAL to SLOW.

Program for waiting time MOV WAIT_CONST, D0	High speed oscillation clock [MHz]	Setting value of WAIT_CONST (decimal)
LOOP NOP	17	195
NOP	18	206
NOP	19	218
ADD -1, D0	20	229
BNE LOOP	low speed oscillat	ion clock - 32 768 kt

low speed oscillation clock = 32.768 kHz

(2) When the execution time at NORMAL is above that duration, also its possibility will be cleared at IDLE.

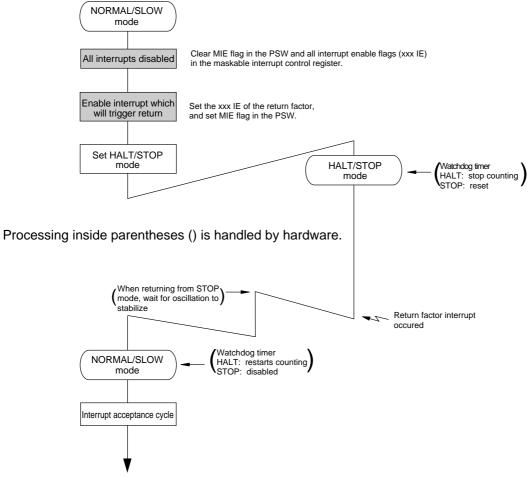

Set the program for switching to SLOW mode, not to NORMAL mode from IDLE.

# 2-4-4 Transition to STANDBY Modes

The program initiates transitions from a CPU operating mode to the corresponding STANDBY (HALT/ STOP) modes by specifying the new mode in the CPU mode control register (CPUM). Interrupts initiate the return to the former CPU operating mode.

Before initiating a transition to a STANDBY mode, however, the program must

- (1) Set the maskable interrupt enable flag (MIE) in the processor status word (PSW) to '0' to disable all maskable interrupts temporarily.
- (2) Set the interrupt enable flags (xxxIE) in the interrupt control registers (xxxICR) to '1' or '0' to specify which interrupts do and do not initiate the return from the STANDBY mode. Set MIE '1' to enable those maskable interrupts.

If the interrupt is enabled but interrupt priority level of the interrupt to be used is not equal to or higher than the mask level in PSW before transition to HALT or STOP mode, it is impossible to return to CPU operation mode by maskable interrupt.

#### ■Transition to HALT modes

The system transfers from NORMAL mode to HALT0 mode, and from SLOW mode to HALT1 mode. The CPU stops operating, but the oscillators remain operational. There are two ways to leave a HALT mode: a reset or an interrupt. A reset produces a normal reset; an interrupt, an immediate return to the CPU state prior to the transition to the HALT mode. The watchdog timer, if enabled, resumes counting.

Program 4		
	MOV	x'4', D0 ; Set HALT0 mode.
	MOV	D0, (CPUM)
	NOP	; After written in CPUM, some NOP
	NOP	; instructions (three or less) are
	NOP	; executed.
Program 5		
r tografii 5	MOV	x'7', D0 ; Set HALT1 mode.
	MOV	D0, (CPUM)
	NOP	; After written in CPUM, some NOP
	NOP	; instructions (three or less) are
	NOP	; executed.

#### ■Transition to STOP mode

The system transfers from NORMAL mode to STOP0 mode, and from SLOW mode to STOP1 mode. In both cases, oscillation and the CPU are both halted. There are two ways to leave a STOP mode: a reset or an interrupt.

Program 6			
	MOV	x'8', D0	; Set STOP0 mode
	MOV	D0, (CPUM)	
	NOP		; After written in CPUM, some NOP
	NOP		; instructions (three or less) are
	NOP		; executed.
Program 7			
riogram	MOV	x'B', D0	; Set STOP1 mode
	MOV	D0, (CPUM)	
	NOP		; After written in CPUM, some NOP
	NOP		; instructions (three or less) are

Right after the instruction of the transition to HALT, STOP mode, NOP instruction should be inserted 3 times.

# 2-5 Reset

## 2-5-1 Reset operation

The CPU contents are reset and registers are initialized when the NRST pin (P27) is pulled to low.

#### ■Initiating a Reset

There are two methods to initiate a reset.

- (1) Drive the NRST pin low.
  - NRST pin should be held "low" for more than OSC 4 clock cycles (200 ns at a 20 MHz).

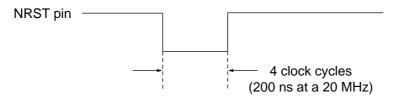

Figure 2-5-1 Minimum Reset Pulse Width

(2) Setting the P2OUT7 flag of the P2OUT register to "0" outputs low level at P27 (NRST) pin. And transferring to reset by program (software reset) can be executed. If the internal LSI is reset and register is initiated, the P2OUT7 flag becomes "1" and reset is released.

[ Crapter 4. 4-4-2 Registers ]

When NRST pin is connected to low power voltage, circuit that gives pulse for enough low level time at sudden unconnected. And reset can be generated even if NRST pin is held "low" for less than OSC 4 clock cycles, take notice of noise.

#### ■Sequence at Reset

- (1) When reset pin comes to high level from low level, the internal 14-bit counter (It can be used as watchdog timer, too.) starts its operation by system clock. The period from starting its count from its overflow is called oscillation stabilization wait time.
- (2) During reset, internal register and special function register are initiated.
- (3) After oscillation stabilization wait time, internal reset is released and program is started from the address written at address x'04000' at interrupt vector table.

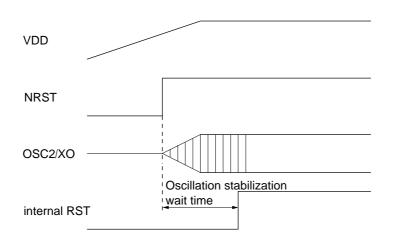

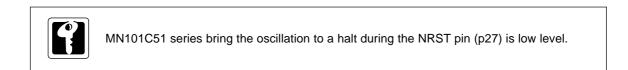

Figure 2-5-2 Reset Released Sequence

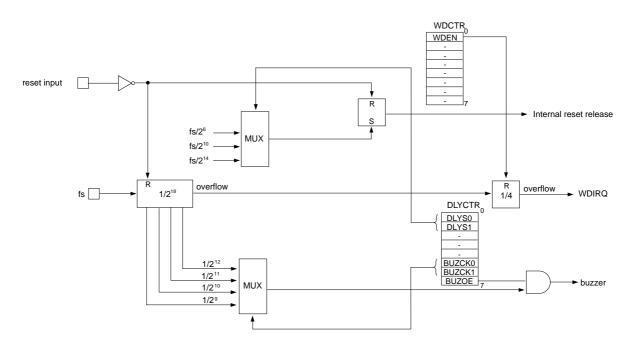

## 2-5-2 Oscillation Stabilization Wait time

Oscillation stabilization wait time is the period from the stop of oscillation circuit to the stabilization for oscillation. Oscillation stabilization wait time is automatically inserted at releasing from reset and at recovering from STOP mode. At recovering from STOP mode the oscillation stabilization wait time control register (DLYCTR) is set to select the oscillation stabilization wait time. At releasing from reset, oscillation stabilization wait time is fixed.

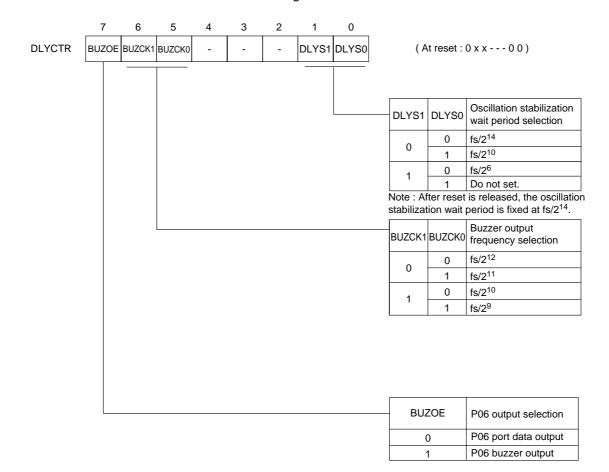

The timer that counts oscillation stabilization wait time is also used as a watchdog timer at anytime except at releasing from reset and at recovering from STOP mode. Watchdog timer is initiated at reset and at STOP mode and starts counting from the initialize value (x'0000') when system clock (fs) is as clock source. After oscillation stabilization wait time, it continues counting as a watchdog timer.

[ Cr Chapter 8 Watchdog timer ]

Block Diagram of Oscillation Stabilization Wait Time (watchdog timer)

Figure 2-5-3 Block Diagram of Oscillation Stabilization Wait Time (watchdog timer)

#### ■Oscillation Stabilization Wait Time Control Register

#### Figure 2-5-4 Oscillation Stabilization Wait Time Control Register (DLYCTR : x'03F03', R/W)

Control the Oscillation Stabilization Wait Time

At recovering from STOP mode, the bit 1-0 (DLYS1, DLYS0) of the oscillation stabilization wait time control register can be set to select the oscillation stabilization wait time from 2<sup>14</sup>, 2<sup>10</sup>, 2<sup>6</sup> x system clock. The DLYCTR register is also used for controlling of buzzer functions.

[ C Chapter 9 Buzzer ]

At releasing from reset, the oscillation stabilization wait time is fixed to "2<sup>14</sup> x system clock". System clock is determined by the CPU mode control register (CPUM).

DLYS1	DLYS0	period	Oscillation stabilization wait time (at fosc = 20 MHz)
0	0	2 <sup>14</sup> x Systemclock	1.6384 ms
0	1	2 <sup>10</sup> x Systemclock	102.4 μs
1	0	2 <sup>6</sup> x Systemclock	6.4 μs
1	1	Do not set.	

Table 2-5-1 Oscillation Stabilization Wait Time

# Chapter 3 Interrupts

# 3-1 Overview

This LSI speeds up interrupt response with circuitry that automatically loads the branch address to the corresponding interrupt service routine from an interrupt vector table : reset, non-maskable interrupts (NMI), 12 maskable peripheral interrupts, and 5 external interrupts.

For interrupts other than reset, the interrupt processing sequence consists of interrupt request, interrupt acceptance, and hardware processing. After the interrupt is accepted, the program counter (PC) and processor status word (PSW) and handy addressing data (HA) are saved onto the stack. And an interrupts handler ends by restoring, using the POP instruction and other means, the contents of any registers used during processing and then executing the return from interrupt (RTI) instruction to return to the point at which execution was interrupted. Max.12 machine cycles before execution, and max 11 machine cycles after execution.

Each interrupt has an interrupt control register, which controls the interrupts. Interrupt control register consists of the interrupt level field (LV1-0), interrupt enable flag (IE), and interrupt request flag (IR).

Interrupt request flag (IR) is set to "1" by an interrupt request, and cleared to "0" by the interrupt acceptance. This flag is managed by hardware, but can be rewritten by software.

Interrupt enable flag (IE) is the flag that enables interrupts in the group. There is no interrupt enable flag in non-maskable interrupt (NMI). Once this interrupt request flag is set, it is accepted without any conditions. Interrupt enable flag is set in maskable interrupt. Interrupt enable flag (IE) of each maskable interrupt is valid when the maskable interrupt enable flag (MIE flag) of PSW is "1".

Maskable interrupts have had vector numbers by hardware, but their priority can be changed by setting interrupts level field. There are three hierarchical interrupt levels. If multiple interrupts have the same priority, the one with the lowest vector number takes priority. Maskable interrupts are accepted when its level is higher than the interrupt mask level (IM1-0) of PSW. Non-maskable interrupts are always accepted, regardless of the interrupt mask level.

# 3-1-1 Functions

Interrupt type	Reset (interrupt)	Non-maskable interrupt	Maskable interrupt
Vector number	0	1	2 to 18
Table address	x'04000'	x'04004'	x'04008' to x'04048'
Starting address		Address specified by vec	tor address
Interrupt level	-	-	Level 0 to 2 (Set by software)
Interrupt factor	External RST pin input	Errors detection, PI interrupt	External pin input Internal peripheral function
Generated operation	Direct input to CPU core	Input to CPU core from non-maskable interrupt control register (NMICR)	Input interrupt request level set in interrupt level flag (xxxLVn) of maskable interrupt control register (xxxICR) to CPU core.
Accept operation	Always accepts	Always accepts	Acceptance only by the interrupt control of the register (xxxlCR) and the interrupt mask level in PSW.
Machine cycles until acceptance	12	12	12
PSW status after acceptance	All flags are cleared to "0".	The interrupt mask level flag in PSW is cleared to "00".	Values of the interrupt level flag (xxxLVn) are set to the interrupt mask level (masking all interrupt requests with the same or the lower priority).

### Table 3-1-1 Interrupt Functions

# 3-1-2 Block Diagram

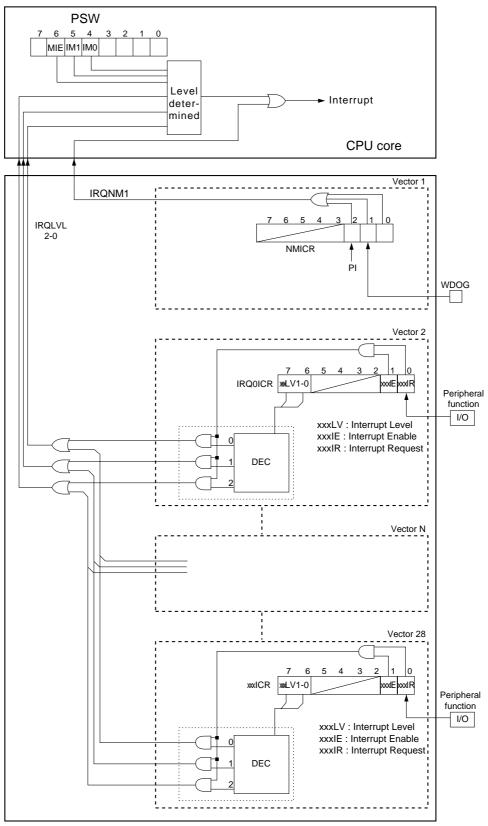

Figure 3-1-1 Interrupt Block Diagram

### 3-1-3 Operation

#### ■Interrupt Processing Sequence

For interrupts other than reset, the interrupt processing sequence consists of interrupt request, interrupt acceptance, and hardware processing. The program counter (PC) and processor status word (PSW) and handy addressing data (HA) are saved onto the stack, and execution branches to the address specified by the corresponding interrupt vector.

An interrupt handler ends by restoring the contents of any registers used during processing and then executing the return from interrupt (RTI) instruction to return to the point at which execution was interrupted.

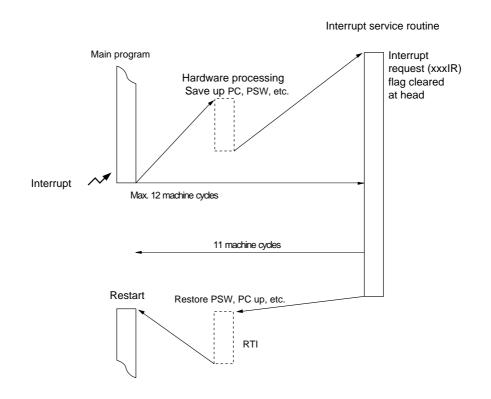

Figure 3-1-2 Interrupt Processing Sequence (maskable interrupts)

	Non-maskable interrupts have priority over maskable ones.
--	---

#### ■Interrupt Sources and Vector Addresses

Here is the list of interrupt vector address and interrupt group.

Vector Number	Vector Address	Interrupt group (Interrupt source)		Control Register (address)	
0	x'04000'	Reset	-	-	-
1	x'04004'	Non-maskable interrupt	NMI	NMICR	x'03FE1'
2	x'04008'	External interrupt 0	IRQ0	<b>IRQ0ICR</b>	x'03FE2'
3	x'0400C'	External interrupt 1	IRQ1	IRQ1ICR	x'03FE3'
4	x'04010'	Timer 0 interrupt	TM0IRQ	TM0ICR	x'03FE4'
5	x'04014'	Timer 1 interrupt	TM1IRQ	TM1ICR	x'03FE5'
6	x'04018'	Timer 2 interrupt	TM2IRQ	TM2ICR	x'03FE6'
7	x'0401C'	Time base period	TBIRQ	TBICR	x'03FE7'
8	x'04020'	Serial interface 0 interrupt	SCOIRQ	SCOICR	x'03FE8'
9	x'04024'	ATC interrupt	ATCIRQ	ATCICR	x'03FE9'
10	x'04028'	AD converter interrupt	ADIRQ	ADICR	x'03FEA'
11	x'0402C'	External interrupt 2	IRQ2	IRQ2ICR	x'03FEB'
12	x'04030'	External interrupt 3	IRQ3	IRQ3ICR	x'03FEC'
13	x'04034'	External interrupt 4	IRQ4	IRQ4ICR	x'03FED'
14	x'04038'	Timer 3 interrupt	TM3IRQ	TM3ICR	x'03FEE'
15	x'0403C'	Timer 4 interrupt	TM4IRQ	TM4ICR	x'03FEF'
16	x'04040'	Timer 5 interrupt	TM5IRQ	TM5ICR	x'03FF0'
17	x'04044'	Serial interface 1 interrupt	SC1IRQ	SC1ICR	x'03FF1'
18	x'04048'	Serial interface 2 interrupt	SC2IRQ	SC2ICR	x'03FF2'
19	x'0404C'	Reserved	-	-	x'03FF3'
20	x'04050'	Reserved	-	-	x'03FF4'

#### Table 3-1-2 Interrupt Vector Address and Interrupt Group

For unused interrupts and reserved interrupts, set the address the RTI instruction is described on to the corresponded address.

#### ■Interrupt Level and Priority

This LSI allocated vector numbers and interrupt control registers (except reset interrupt) to each interrupt. The interrupt level (except reset interrupt, non-maskable interrupt) can be set by software, per each interrupt group. There are three hierarchical interrupt levels. If multiple interrupts have the same priority, the one with the lowest vector number takes priority. For example, if a vector 3 set to level 1 and a vector 4 set to level 2 request interrupts simultaneously, vector 3 will be accepted.

		Vector 1 (Non-maskable interrupt)	Priority	Interrupt vector No.
			1	Vector 1
1	Level 0	Vectors 2, 5, 6	2	Vector 2
			3	Vector 5
Interrupt level setting range	Level 1	Vector 3	4	Vector 6
Setting range			5	Vector 3
	Level 2	Vectors 4, 8	6	Vector 4
•	1		7	Vector 8

Figure 3-1-3 Interrupt Priority Outline

#### ■Determination of Interrupt Acceptance

The following is the procedure from interrupt request input to acceptance.

- (1) The interrupt request flag (xxxIR) in the corresponding external interrupt control register (IRQnICR) or internal interrupt control register (xxxICR) is set to '1'.
- (2) An interrupt request is input to the CPU, If the interrupt enable flag (xxxIE) in the same register is '1'.
- (3) The interrupt level (IL) is set for each interrupt. The interrupt level (IL) is input to the CPU.
- (4) The interrupt request is accepted, If IL has higher priority than IM and MIE is '1'.
- (5) After the interrupt is accepted, the hardware resets the interrupt request flag (xxxIR) in the interrupt control register (xxxICR) to '0'.

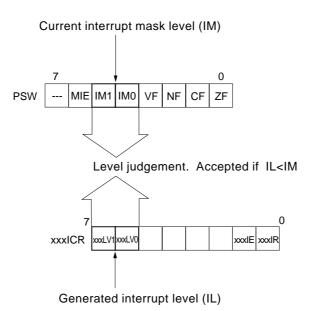

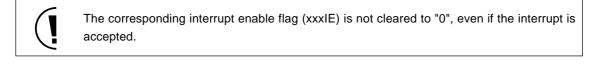

Figure 3-1-4 Determination of Interrupt Acceptance

When the setting is xxxLV1=1, xxxLV0=1, the interrupt is disabled regardless of the value of xxxIE, xxxIR.

MIE='0' and interrupts are disabled when:

- MIE in the PSW is reset to '0' by a program
- Reset is detected

MIE='1' and interrupts are enabled when:

- MIE in the PSW is set to '1' by a program

The interrupt mask level (IM=IM1 - IM0) in the processor status word (PSW) changes when:

- The program alters it directly,
- A reset initializes it to 0 (00b),
- The hardware accepts and thus switches to the interrupt level (IL) for a maskable interrupt.
- Execution of the RTI instruction at the end of an interrupt service routine restores the processor status word (PSW) and thus the previous interrupt mask level.

The maskable interrupt enable (MIE) flag in the processor status word (PSW) is not cleared to "0" when an interrupt is accepted.

Non-maskable interrupts have priority over maskable ones.

#### ■Interrupt Acceptance Operation

When accepting an interrupt, the MN101C51F series hardware saves the handy address register, the return address from the program counter, and the processor status word (PSW) to the stack and branches to the interrupt handler using the starting address in the vector table.

The following is the hardware processing sequence after interrupt acceptance.

1. The stack pointer (SP) is updated.

 $(SP-6 \rightarrow SP)$ 

2. The contents of the handy address register (HA) are saved to the stack.

Upper half of HA  $\rightarrow$  (SP+5)

Lower half of HA  $\rightarrow$  (SP+4)

- 3. The contents of the program counter (PC), the return 0 address, are saved to the stack. New SP PC bits 18, 17, and  $0 \rightarrow (SP+3)$ PSW Lower (after interrupt PC8 - 1 PC bits 16-9  $\rightarrow$  (SP+2) acceptance) PC16 - 9 PC bits 8-1  $\rightarrow$  (SP+1) PC0 reserved PC 18,17 4. The contents of the PSW are saved to the stack. HA 7 - 0  $\mathsf{PSW} \rightarrow (\mathsf{SP})$ The interrupt level (xxxLVn) for the interrupt is copied to HA 15 - 8 5.
- the interrupt mask (IMn) in the PSW. Interrupt level (xxxLVn)  $\rightarrow$  IMn

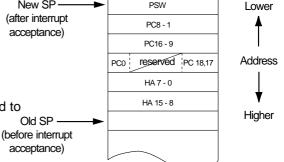

Figure 3-1-5 Stack Operation during interrupt acceptance

The hardware branches to the address in the vector 6. table.

#### ■Interrupt Return Operation

An interrupt handler ends by restoring, using the POP instruction and other means, the contents of any registers used during processing and then executing the return from interrupt (RTI) instruction to return to the point at which execution was interrupted.

The following is the processing sequence after the RTI instruction.

- The contents of the PSW are restored from the stack. (SP) 1.
- 2. The contents of the program counter (PC), the return address, are restored from the stack. (SP+1 to SP+3)
- 3. The contents of the handy address register (HA) are restored from the stack. (SP+4, SP+5)
- 4. The stack pointer is updated. (SP+6  $\rightarrow$  SP)
- 5. Execution branches to the address in the program counter.

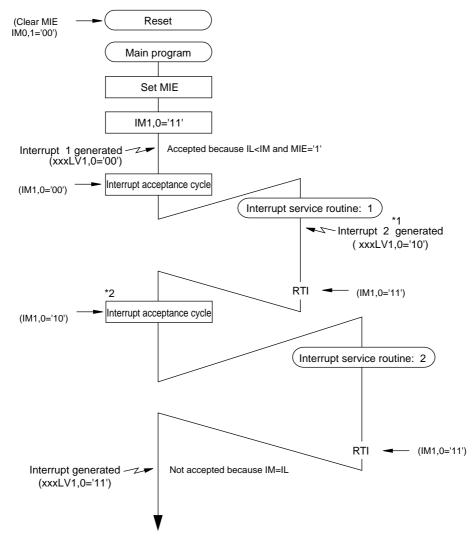

The handy address register is an internal register used by the handy addressing function. The hardware saves its contents to the stack to prevent the interrupt from interfering with operation of the function.

> Registers such as data register, or address register are not saved, so that PUSH instruction should be used to save data register or address register onto the stack, if necessary.

> The address bp6 to bp2, when program counter (PC) are saved to the stack, are reserved. Do not change by program.

#### ■Maskable Interrupt

Figure 3-1-6 shows the processing flow when a second interrupt with a lower priority level (xxxLV1xxxLV0='10') arrives during the processing of one with a higher priority level (xxxLV1-xxxLV0='00').

Parentheses () indicate hardware processing.

- \*1 If during the processing of the first interrupt, an interrupt request with an interrupt level (IL) numerically lower than the interrupt mask (IM) arrives, it is accepted as a nested interrupt. If IL ≥ IM, however, the interrupt is not accepted.
- \*2 The second interrupt, postponed because its interrupt level (IL) was numerically greater than the interrupt mask (IM) for the first interrupt service routine, is accepted when the first interrupt handler returns.

#### Figure 3-1-6 Processing Sequence for Maskable Interrupts

#### ■Multiplex Interrupt

When an MN101C51 series device accepts an interrupt, it automatically disables acceptance of subsequent interrupts with the same or lower priority level. When the hardware accepts an interrupt, it copies the interrupt level (xxxLVn) for the interrupt to the interrupt mask (IM) in the PSW. As a result, subsequent interrupts with the same or lower priority levels are automatically masked. Only interrupts with higher priority levels are accepted. The net result is that interrupts are normally processed in decreasing order of priority. It is, however, possible to alter this arrangement.

- 1. To disable interrupt nesting
  - Reset the MIE bit in the PSW to "0."
  - Raise the priority level of the interrupt mask (IM) in the PSW.
- 2. To enable interrupts with lower priority than the currently accepted interrupt
  - Lower the priority level of the interrupt mask (IM) in the PSW.

Multiplex interrupts are only enabled for interrupts with levels higher than the PSW interrupt mask level (IM).

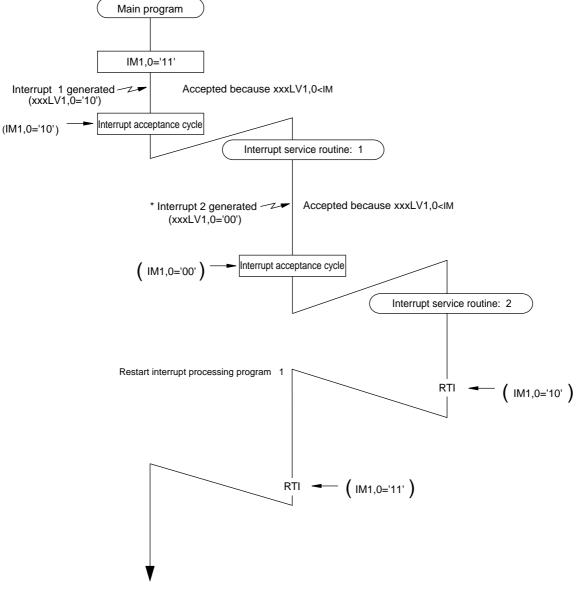

It is possible to forcibly rewrite IM to accept an interrupt with a priority lower than the interrupt being processed, but be careful of stack overflow.

Do not operate the maskable interrupt control register (xxxICR) when multiple interrupts are enabled. If operation is necessary, first clear the PSW MIE flag to disable interrupts.

Figure 3-1-7 shows the processing flow for multiple interrupts (interrupt 1: xxxLV1-xxxLV0='10', and interrupt 2: xxxLV1-xxxLV0='00').

Parentheses () indicate hardware processing

#### Figure 3-1-7 Processing Sequence with Multiple Interrupts Enabled

# 3-1-4 Interrupt Flag Setup

#### ■ Interrupt request flag (IR) setup by the software

The interrupt request flag is operated by the hardware. That is set to "1" when any interrupt factor is generated, and cleared to "0" when the interrupt is accepted. If you want to operate it by the software, the IRWE flag of MEMCTR should be set to "1".

#### ■ Interrupt flag setup procedure

A setup procedure of the interrupt request flag set by the hardware and the software shows as follows ;

Setup Procedure	Description
<ul><li>(1) Disable all maskable interrupts.</li><li>PSW</li><li>bp6 : MIE = 0</li></ul>	<ul> <li>(1) Clear the MIE flag of PSW to disable all maskable interrupts. This is necessary, especially when the interrupt control register is</li> </ul>
(2) Select the interrupt factor.	<ul><li>changed.</li><li>(2) Select the interrupt factor such as interrupt edge selection, or timer interrupt cycle change.</li></ul>
<ul> <li>(3) Enable the interrupt request flag to be rewritten.</li> <li>MEMCTR (x'3F01')</li> <li>bp2 : IRWE = 1</li> </ul>	(3) Set the IRWE flag of MEMCTR to enable the interrupt request flag to be rewritten. This is necessary only when the interrupt request flag is changed by the software.
(4) Rewrite the interrupt request flag. xxxICR	<ul><li>(4) Rewrite the interrupt request flag (xxxIR) of the interrupt control register (xxxICR).</li></ul>
bp0 : xxxIR (5) Disable the interrupt request flag to be rewritten. MEMCTR (x'3F01') bp2 : IRWE = 0	(5) Clear the IRWE flag so that interrupt request flag can not be rewritten by the software.
(6) Set the interrupt level. xxxICR bp7-6 : xxxLV1-0 PSW	<ul> <li>Set the interrupt level by the xxxLV1-0 flag of the interrupt control register (xxxICR).</li> <li>Set the IM1-0 flag of PSW when the interrupt acceptance level of CPU should be changed.</li> </ul>
bp5-4 : IM1-0 (7) Enable the interrupt. xxxICR bp1 : xxxIE = 1	(7) Set the xxxIE flag of the interrupt control register (xxxICR) to enable the interrupt.
(8) Enable all maskable interrupts. PSW bp6 : MIE = 1	(8) Set the MIE flag of PSW to enable maskable interrupts.

Table 3-2-1 Interrupt Control Registers

Writing to the interrupt control register should be done after that all maskable interrupts are set to be disabled by the MIE flag of the PSW register.

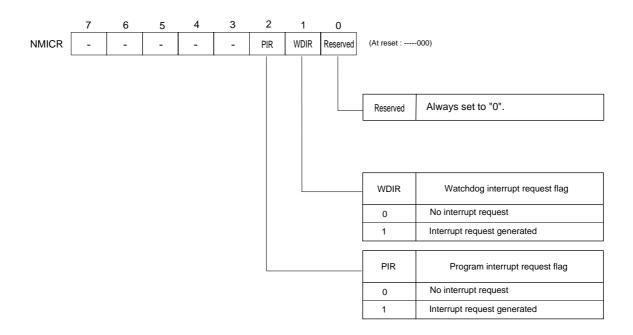

If the interrupt level flag (xxxLVn) is set to "level 3", its vector is disabled, regardless of interrupt enable flag and interrupt request flag.

# 3-2-2 Interrupt Control Registers

The interrupt control registers include the non-maskable interrupt control register (NMICR), the external interrupt control register (IRQnICR) and the internal interrupt control register (xxxICR).

■Non-Maskable Interrupt Control Register (NMICR address: x'03FE1')

The non-maskable interrupt control register (NMICR) stores the non maskable interrupt request. When the non-maskable interrupt request is generated, the interrupt is accepted regardless of the interrupt mask level (IMn) of PSW. The hardware then branches to the address stored at location x'04004' in the interrupt vector table. The watchdog timer overflow interrupt request flag (WDIR) is set to "1" when the watchdog timer overflows. The program interrupt request flag (PIR) is set to "1" when the undefined instruction is executed.

On this LSI, when undefined instruction is decoded, the program interrupt request flag (PIR) is set to "1", and the non-maskable interrupt is generated.

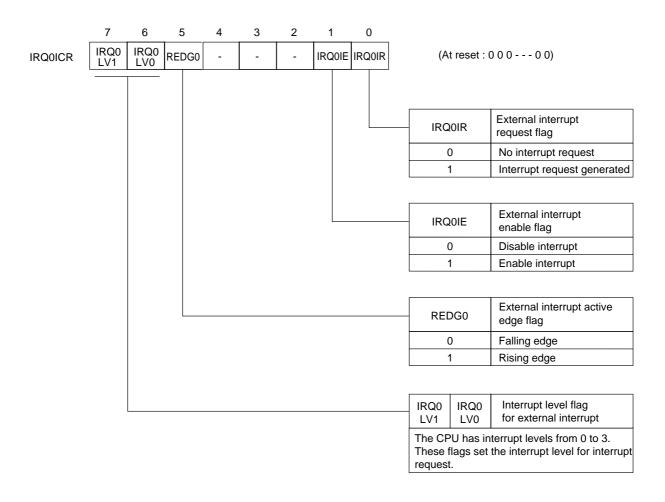

If the PIR flag setup is confirmed by the non-maskable interrupt service routine, the reset via the software is recommended. When software reset, the reset pin (P27) outputs "0".

Once the WDIR becomes "1" by generating of non-maskable interrupt, only the program can clear it to "0".

#### ■External Interrupt 0 Control Register (IRQ0ICR)

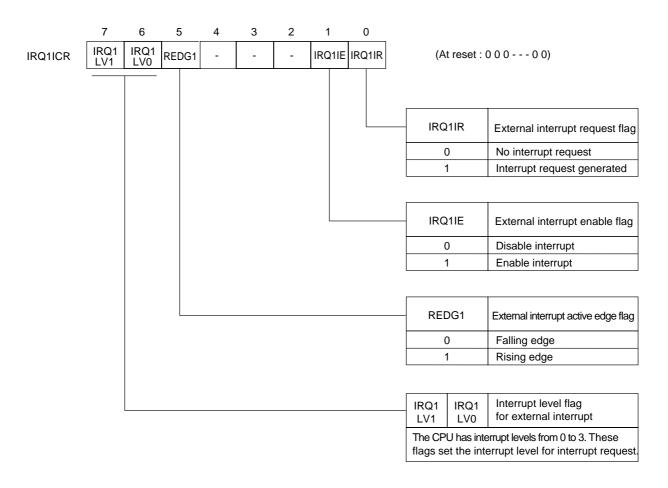

The external interrupt 0 control register (IRQ0ICR) controls interrupt level of the external interrupt 0, active edge, interrupt enable and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag for external interrupt is set to level 3 (IRQ0LV1=IRQ0LV0="1"), the interrupt of its vector is disabled regardless of the external interrupt request flag and the external interrupt enable flag.

#### Figure 3-2-2 External Interrupt 0 Control Register (IRQ0ICR : x'03FE2', R/W)

#### ■External Interrupt 1 Control Register (IRQ1ICR)

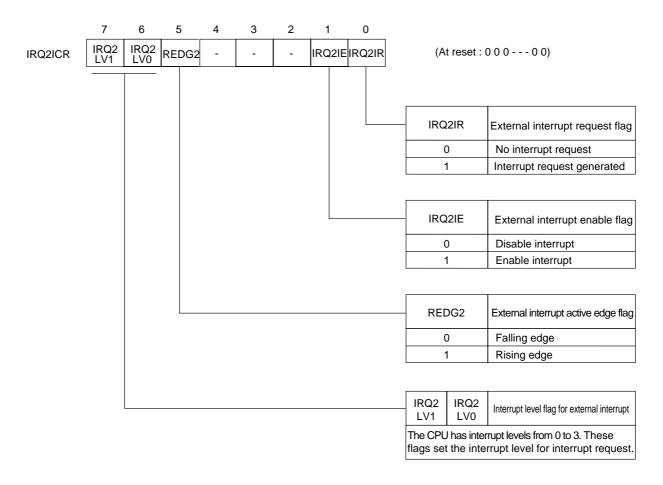

The external interrupt 1 control register (IRQ1ICR) controls interrupt level of external interrupt 1, active edge, interrupt enable and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag for external interrupt is set to level 3 (IRQ1LV1=IRQ1LV0="1"), the interrupt of its vector is disabled regardless of the external interrupt request flag and the external interrupt enable flag.

#### ■External Interrupt 2 Control Register (IRQ2ICR)

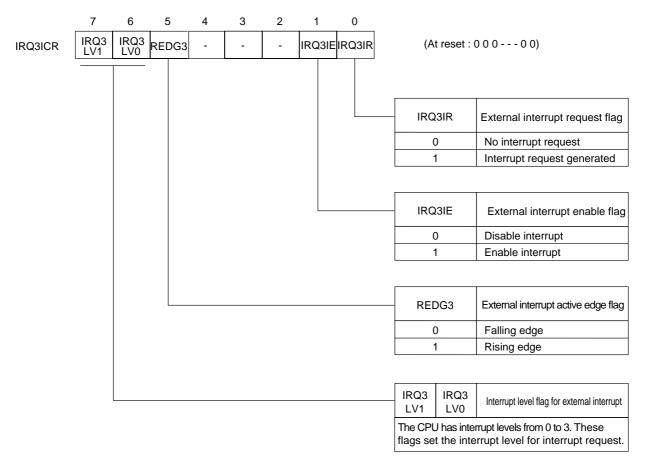

The external interrupt 2 control register (IRQ2ICR) controls interrupt level of external interrupt 2, active edge, interrupt enable and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag for external interrupt is set to level 3 (IRQ2LV0=IRQ2LV1="1"), the interrupt of its vector is disabled regardless of the external interrupt request flag and the external interrupt enable flag.

#### Figure 3-2-4 External Interrupt 2 Control Register (IRQ2ICR : x'03FEB', R/W)

#### ■External Interrupt 3 Control Register (IRQ3ICR)

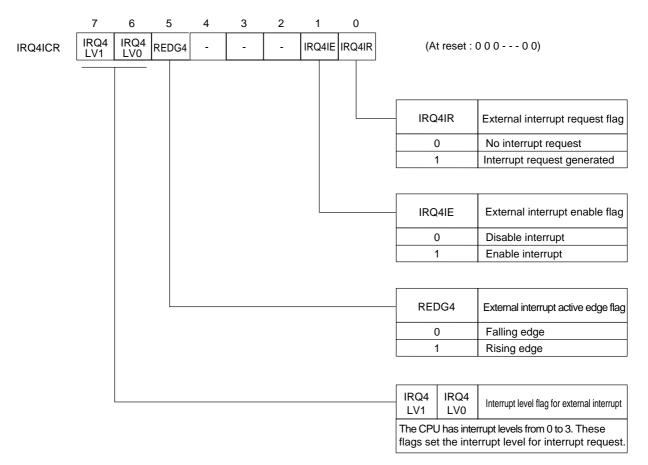

The external interrupt 3 control register (IRQ3ICR) controls interrupt level of external interrupt 3, active edge, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag for external interrupt is set to level 3 (IRQ3LV1=IRQ3LV0="1"), the interrupt of its vector is disabled regardless of the external interrupt request flag and the external interrupt enable flag.

#### ■External Interrupt 4 Control Register (IRQ4ICR)

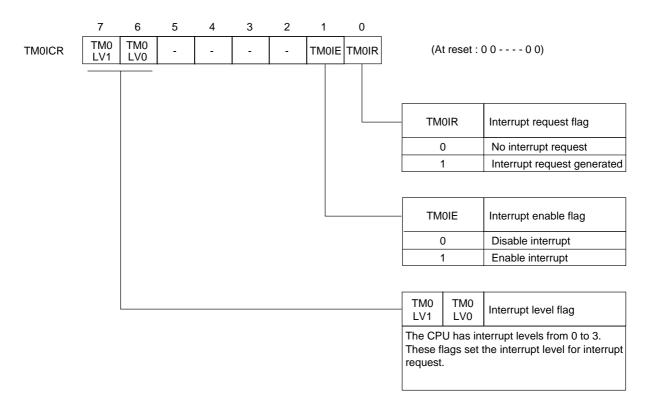

The external interrupt 4 control register (IRQ4ICR) controls interrupt level of external interrupt 4, active edge, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag for external interrupt is set to level 3 (IRQ4LV1=IRQ4LV0="1"), the interrupt of its vector is disabled regardless of the external interrupt request flag and the external interrupt enable flag.

#### Figure 3-2-6 External Interrupt 4 Control Register (IRQ4ICR : x'03FED', R/W)

#### ■Timer 0 Interrupt Control Register (TM0ICR)

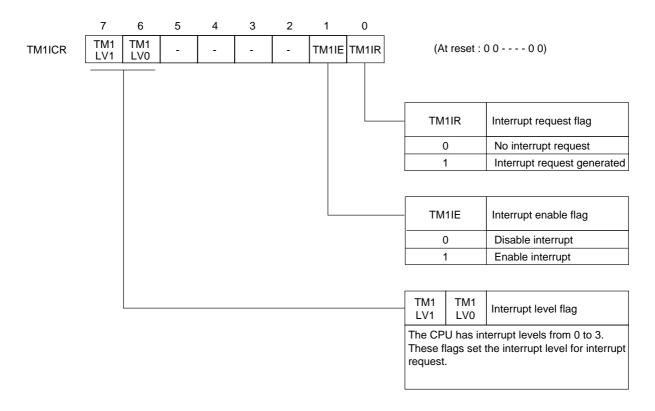

The timer 0 interrupt control register (TM0ICR) controls interrupt level of timer 0 interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (TM0LV1=TM0LV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

#### Figure 3-2-7 Timer 0 Interrupt Control Register (TM0ICR : x'03FE4', R/W)

### Timer 1 Interrupt Control Register (TM1ICR)

The timer 1 interrupt control register (TM1ICR) controls interrupt level of timer 1 interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (TM1LV1=TM1LV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

#### Figure 3-2-8 Timer 1 Interrupt Control Register (TM1ICR : x'03FE5', R/W)

#### ■Timer 2 Interrupt Control Register (TM2ICR)

The timer 2 interrupt control register (TM2ICR) controls interrupt level of timer 2 interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (TM2LV1=TM2LV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

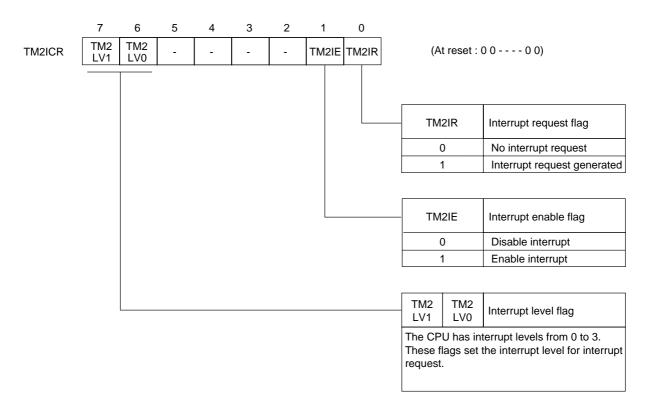

Figure 3-2-9 Timer 2 Interrupt Control Register (TM2ICR : x'03FE6', R/W)

### ■Timer 3 Interrupt Control Register (TM3ICR)

The timer 3 interrupt control register (TM3ICR) controls interrupt level of timer 3 interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (TM3LV1=TM3LV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

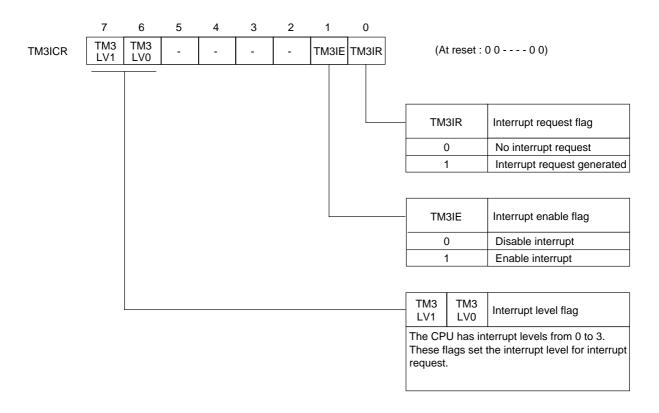

Figure 3-2-10 Timer 3 Interrupt Control Register (TM3ICR : x'03FEE', R/W)

#### ■Timer 4 Interrupt Control Register (TM4ICR)

The timer 4 interrupt control register (TM4ICR) controls interrupt level of timer 4 interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (TM4LV1=TM4LV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

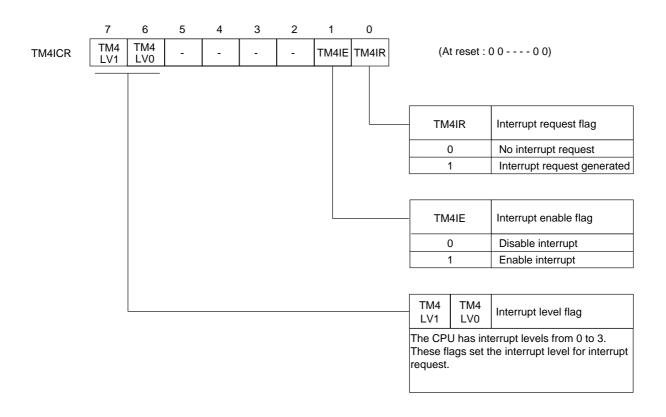

Figure 3-2-11 Timer 4 Interrupt Control Register (TM4ICR : x'03FEF', R/W)

### ■Timer 5 Interrupt Control Register (TM5ICR)

The timer 5 interrupt control register (TM5ICR) controls interrupt level of timer 5 interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (TM5LV1=TM5LV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

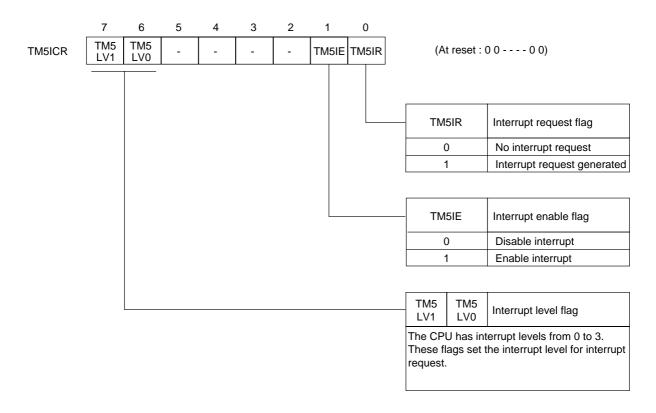

Figure 3-2-12 Timer 5 Interrupt Control Register (TM5ICR : x'03FF0', R/W)

#### ■Time Base Interrupt Control Register (TBICR)

The time base interrupt control register (TBICR) controls interrupt level of time base interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (TBLV1=TBLV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

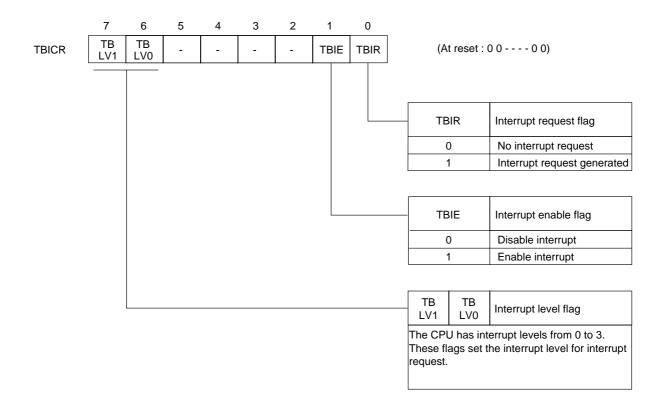

Figure 3-2-13 Time Base Interrupt Control Register (TBICR : x'03FE7', R/W)

### Serial interface 0 Interrupt Control Register (SC0ICR)

The serial interface 0 interrupt control register (SC0ICR) controls interrupt level of serial interface 0 interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (SC0LV1=SC0LV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

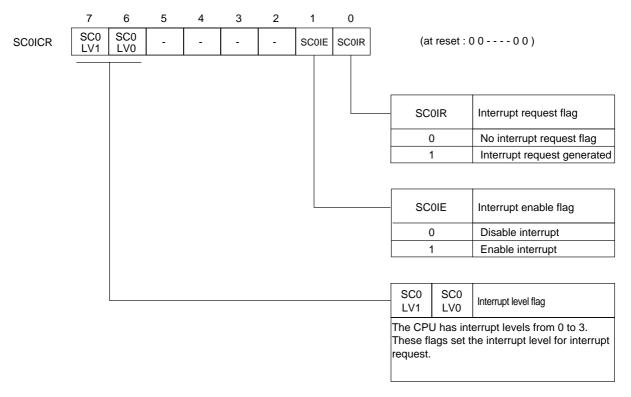

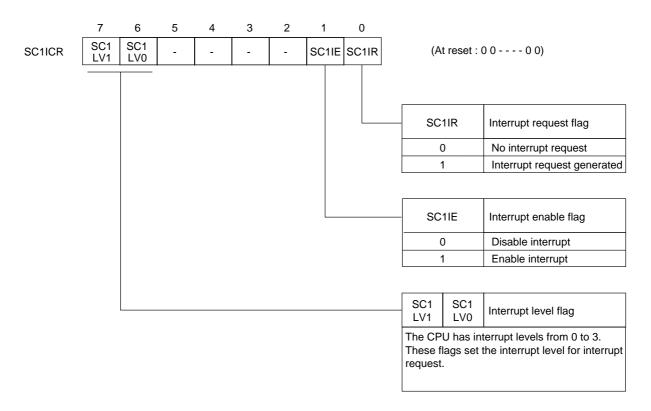

Figure 3-2-14 Serial interface 0 Interrupt Control Register (SC0ICR : x'03FE8', R/W)

### Serial interface 1 Interrupt Control Register (SC1ICR)

The serial interface 1 interrupt control register (SC1ICR) controls interrupt level of serial interface 1 interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (SC1LV1=SC1LV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

#### Figure 3-2-15 Serial interface 1 Interrupt Control Register (SC1ICR : x'03FF1', R/W)

#### Serial interface 2 Interrupt Control Register (SC2ICR)

The serial interface 2 interrupt control register (SC2ICR) controls interrupt level of serial interface 2 interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (SC2LV1=SC2LV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

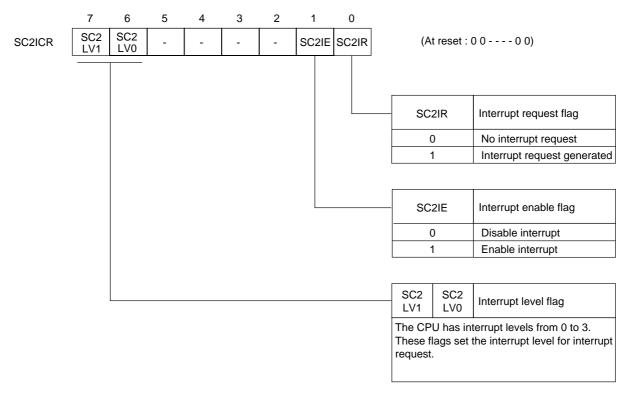

Figure 3-2-16 Serial interface 2 Interrupt Control Register (SC2ICR : x'03FF2', R/W)

### ■A/D Conversion Interrupt Control Register (ADICR)

The A/D conversion interrupt control register (ADICR) controls interrupt level of A/D conversion interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (ADLV1=ADLV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

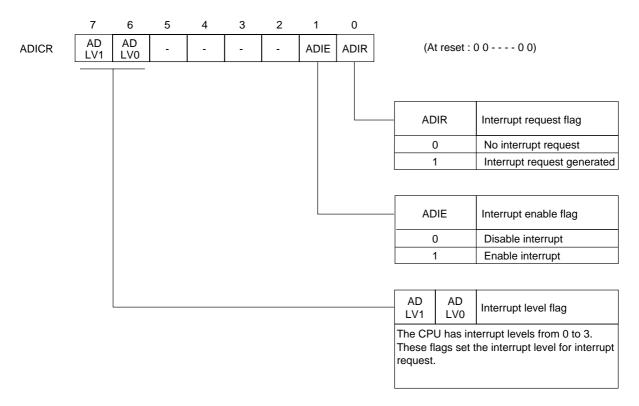

Figure 3-2-17 A/D Conversion Interrupt Control Register (ADICR : x'03FEA', R/W)

### ■ATC Interrupt Control Register (ATCICR)

The ATC interrupt control register (ATC1ICR) controls interrupt level of ATC interrupt, interrupt enable flag and interrupt request. Interrupt control register should be operated when the maskable interrupt enable flag (MIE) of PSW is "0". When the interrupt level flag is set to level 3 (ATCLV1=ATCLV0="1"), the interrupt of its vector is disabled regardless of the interrupt request flag and the interrupt enable flag.

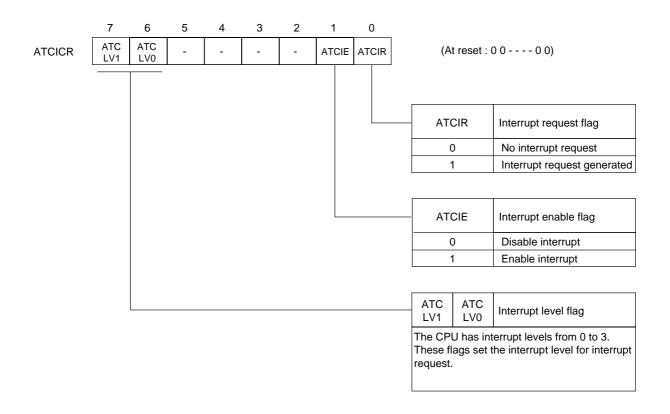

Figure 3-2-18 ATC Interrupt Control Register (ATCICR : x'03FE9', R/W)

## **3-3 External Interrupts**

There are 5 external interrupts in this LSI. The circuit (external interrupt interface) for the external interrupt input signal, is built-in between the external interrupt input pin and the interrupt controller block. This external interrupt interrupt interface can manage to do with any kind of external interrupts.

### 3-3-1 Overview

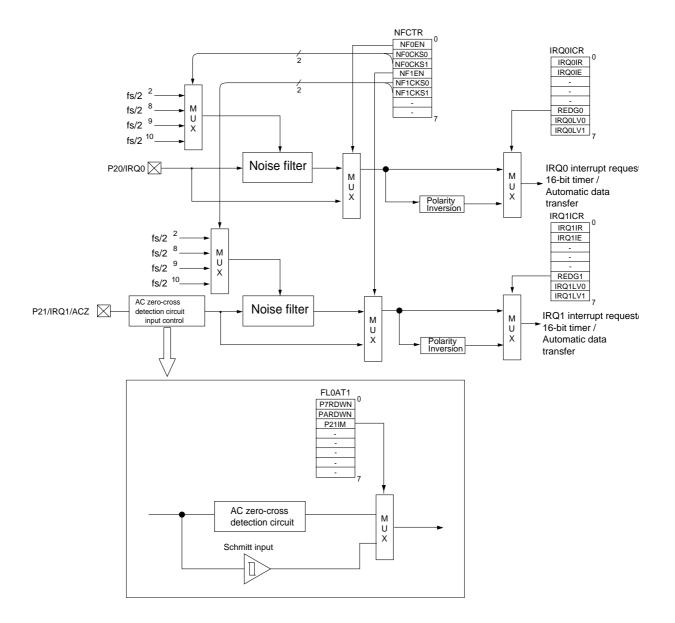

Table 3-3-1 shows the list for functions which external interrupts 0 to 4 can be used.

	External interrupt 0 (IRQ0)	External interrupt 1 (IRQ1)	External interrupt 2 (IRQ2)	External interrupt 3 (IRQ3)	External interrupt 4 (IRQ4)
External interrupt input pin	P20	P21	P22	P23	P24, P40 - P47
Programmable active edge interrupt					√ (P24)
Key input interrupt	-	-	-	-	√ (P40 - P47)
Noise filter built-in			-	-	-
AC zero-cross detection	-		-	-	-
Capture trigger for timer 4				-	-
ATC trigger factor			-	-	-
Port 7 synchronous output event	-	-		-	-

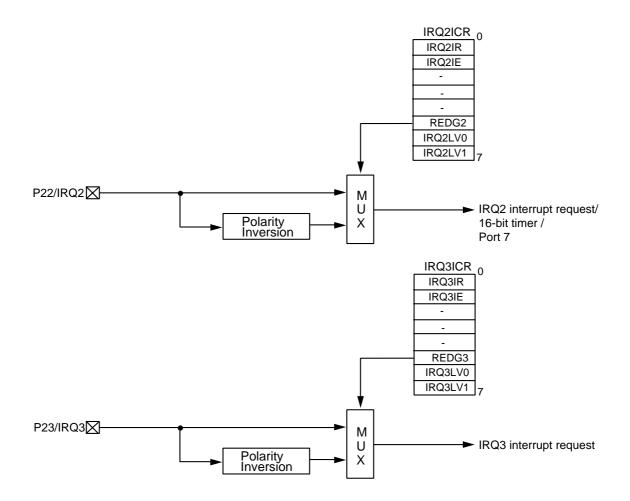

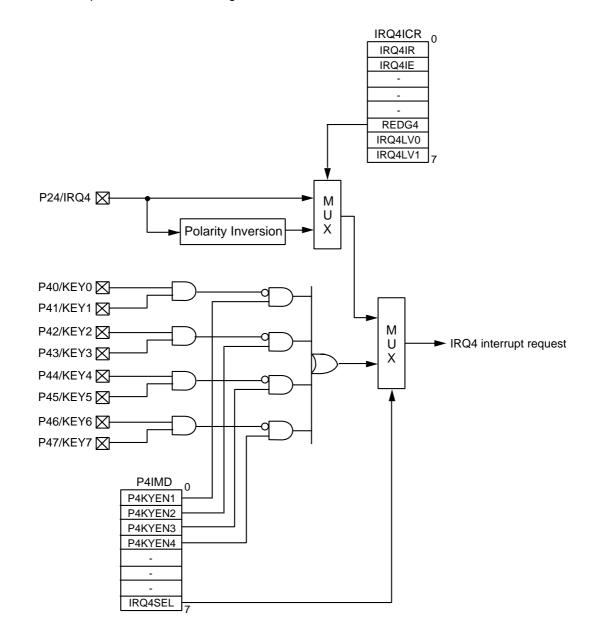

Figure 3-3-2 External Interrupt 2 Interface, External Interrupt 3 Interface

#### ■External Interrupt 4 Interface Block Diagram

Figure 3-3-3 External Interrupt 4 Interface Block Diagram

### 3-3-3 Control Registers

The external interrupt input signals, which operated in each external interrupt 0 to 4 interface generate interrupt requests.

External interrupt 0 to 4 interface are controlled by the external interrupt control register (IRQnICR). And external interrupt interface 0 to 1 are controlled by the noise filter control register (NFCTR), and external interrupt interface 4 is controlled by the port 4 key interrupt control register (P4IMD). When the external interrupt 1 is used for AC zero-cross detection, it is controlled by the pin control register 1 (FLOAT1).

Table 3-3-2 shows the list of registers, control external interrupt 0 to 4.

External Interrupt	Register	Address	R/W	Function	Page
	IRQ0ICR	x'03FE2'	R/W	External interrupt 0 control register	Ⅲ - 17
External interrupt 0	NFCTR	x'03F8A'	R/W	Noise filter control register	III - 39
	IRQ1ICR	x'03FE3'	R/W	External interrupt 1 control register	III - 18
External interrupt 1	NFCTR	x'03F8A'	R/W	Noise filter control register	III - 39
	FLOAT1	x'03F4B'	R/W	Pin control register 1	III - 40
External interrupt 2	IRQ2ICR	x'03FEB'	R/W	External interrupt 2 control register	III - 19
External interrupt 3	IRQ3ICR	x'03FEC'	R/W	External interrupt 3 control register	III - 20
External interrupt 4	IRQ4ICR	x'03FED'	R/W	External interrupt 4 control register	III - 21
	P4IMD	x'03F3C'	R/W	Port 4 key interrupt control register	III - 41

	Table 3-3-2	External Interrupt Control Register
--	-------------	-------------------------------------

R/W : Readable / Writable.

#### ■Noise Filter Control Register (NFCTR)

The noise filter control register (NFCTR) sets the noise remove function to IRQ0 and IRQ1 and also selects the sampling cycle of noise remove function.

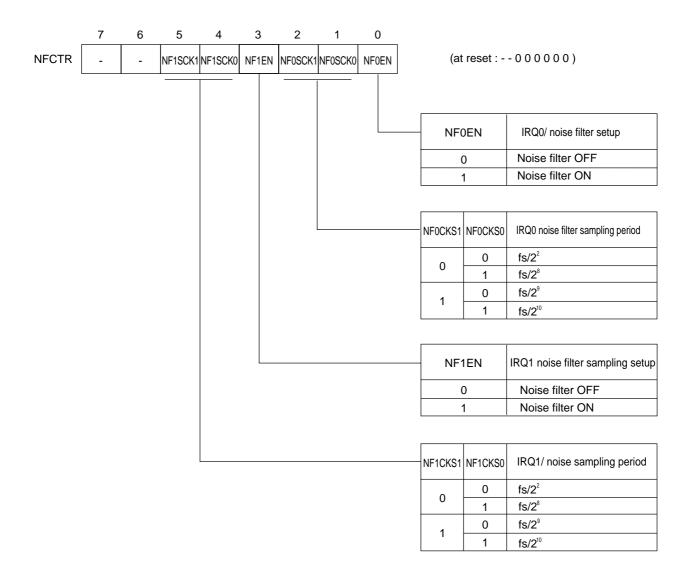

Figure 3-3-4 Noise Filter Control Register (NFCTR : x'03F8A', R/W)

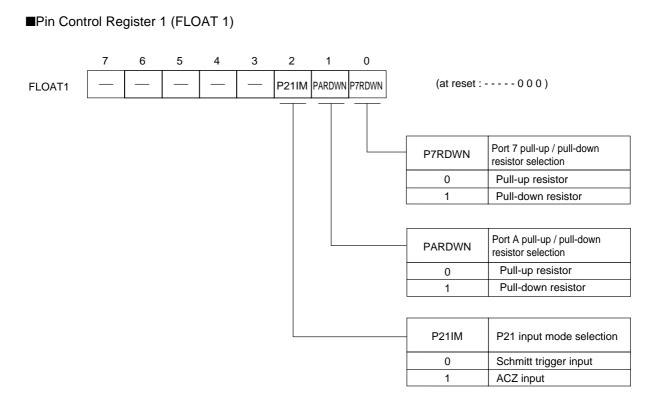

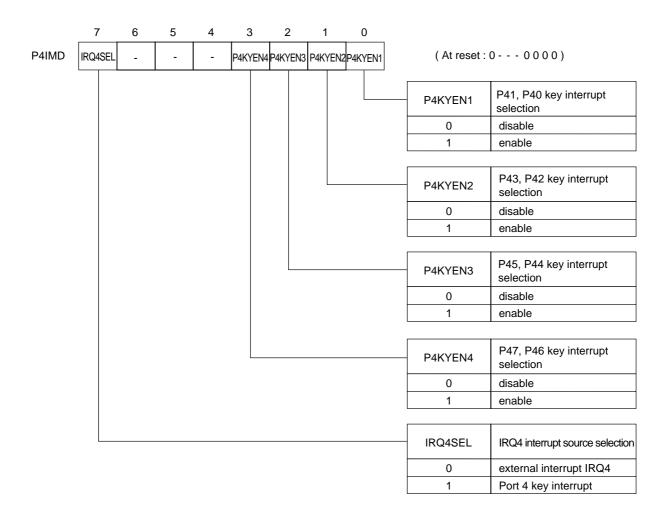

Figure 3-3-5 Pin Control Register 1 (FLOAT1 : x'03F4B', R/W)

#### ■Port 4 Key Interrupt Control Register (P4IMD)

The port 4 key interrupt control register (P4IMD) selects if key interrupt is approved, and if external interrupt IRQ4 is approved. Also, this register selects, by 2 bits, which pin on port 4 approved key interrupt.

#### Figure 3-3-6 Port 4 Key Interrupt Control Register (P4IMD : x'03F3C', R/W)

### 3-3-4 Programmable Active Edge Interrupt

■Programmable Active Edge Interrupts (External interrupts 0 to 4) Through register settings, external interrupts 0 to 4 can generate interrupt at the selected edge either rising or falling edge.

■Programmable Active Edge Interrupt Setup Example (External interrupts 0 to 4) External interrupt 3 (IRQ3) is generated at the rising edge of the input signal from P23. The table below provides a setup example for IRQ3.

Setup Procedure	Description
<ul> <li>(1) Specify the interrupt active edge.</li> <li>IRQ3ICR (x'3FEC')</li> <li>bp5 : REDG3 = 1</li> </ul>	(1) Set the REDG3 flag of the external interrupt 3 control register (IRQ3ICR) to "1" to specify the rising edge as the active edge for interrupts.
(2) Set the interrupt level. IRQ3ICR (x'3FEC') bp7-6 : IRQ3LV1-0= 10	(2) Set the interrupt priority level in the IRQ3LV1-0 flag of the IRQ3ICR register.
	If any interrupt request flag had already been set, clear it. [CP Chapter 3. 3-1-4 Interrupt flag setup ]
<ul> <li>(3) Enable the interrupt.</li> <li>IRQ3ICR (x'3FEC')</li> <li>bp1 : IRQ3IE = 1</li> </ul>	<ul><li>(3) Set the IRQ3IE flag of the IRQ3ICR register to</li><li>"1" to enable the interrupt.</li></ul>

External interrupt 3 is generated at the rising edge of the input signal from P23.

The Interrupt request flag may be set to "1" at switching the interrupt edge, so specify the interrupt active edge before the interrupt permission.

Pull-up the external interrupt pin in advance is also recommended.

### 3-3-5 Key Input Interrupt

■Key Input Interrupt (External interrupt 4)

This LSI can set port 4 pin (P40 - P47) by 2 bits to key input pin. Key input interrupt can generate an interrupt at the falling edge, if at least 1 key input pin outputs low level.

Key input pin should be pull-up in advance.

When port 4 key input interrupt is used, set the REDG4 flag of the external interrupt 4 control register (IRQ4ICR) to "0" (falling edge).

### ■Key Input Interrupt Setup Example (External interrupt 4)

After P40 to P43 of port 4 are set to key input pins and key is input (low level), the external interrupt 4 (IRQ4) is generated. An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description		
<ul> <li>(1) Set the key input pin to input.</li> <li>P4DIR (x'3F34')</li> <li>bp3-0 : P4DIR3-0 = 0000</li> </ul>	<ul> <li>Set the P4DIR3-0 flag of the port 4 direction control register (P4DIR) to "0000" to set P40 to P43 pins to input pins.</li> </ul>		
<ul> <li>Set the pull-up resistance.</li> <li>P4PLU (x'3F44')</li> <li>bp3-0 : P4PLUD3-0 = 1111</li> </ul>	<ul> <li>(2) Set the P4PLUD 3-0 flag of the port 4 pull-up/ down resistor control register (P4PLUD) to "1111" to add the pull-up resistor to P40 to P43 pins.</li> </ul>		
<ul> <li>(3) Select the key input interrupt.</li> <li>P4IMD (x'3F3C')</li> <li>bp7 : IRQ4SEL = 1</li> </ul>	(3) Set the IRQ4SEL flag of the port 4 key interrupt control register (P4IMD) to "1" to select the external interrupt 4 source to the port 4 key interrupt.		
<ul><li>(4) Select the key input pin.</li><li>P4IMD (x'3F3C')</li><li>bp1-0 : P4KYEN2-1= 11</li></ul>	(4) Set the P4KYEN 2-1 flag of the port 4 key interrupt control register (P4IMD) to "11" to set P40 to P43 pins to key input pins.		
<ul><li>(5) Specify the interrupt active edge</li><li>IRQ4ICR (x'3FED')</li><li>bp5 : REDG4 = 0</li></ul>	(5) Specify the falling edge to the interrupt active edge by setting "0" to the REDG4 flag of the external interrupt 4 control register (IRQ4ICR).		
<ul> <li>(6) Set the interrupt level.</li> <li>IRQ4ICR (x'3FED')</li> <li>bp7-6 : IRQ4LV1-0=10</li> </ul>	<ul> <li>(6) Set the interrupt level by the IRQ4LV1-0 flag of the IRQ4ICR register.</li> <li>If the interrupt request flag has been already set, clear it.</li> </ul>		
	[ C Chapter 3 3-1-4. Interrupt flag setup ]		
(7) Enable the interrupt. IRQ4ICR (x'3FED') bp1 : IRQ4IE = 1	(7) Set the IRQ4IE flag of the IRQ4ICR register to "1" to enable the interrupt.		

Note : The above (3) and (4) or (5) and (6) are set at the same time.

If there is at least one input signal, from the P40 to P43 pins, shows low level, the external interrupt 4 is generated at the falling edge.

The setup of the key input should be done before the interrupt is enabled.

### 3-3-6 Noise Filter

### ■Noise Filter (External interrupts 0 to1)

Noise filter reduces noise by sampling the input waveform from the external interrupt pins (IRQ0, IRQ1). Its sampling cycle can be selected from 4 types (fs/2<sup>2</sup>, fs/2<sup>8</sup>, fs/2<sup>9</sup>, fs/2<sup>10</sup>).

■Noise Remove Selection (External interrupts 0 to 1)

Noise remove function can be used by setting the NFnEN flag of the noise filter control register (NFCTR) to "1".

NFnEN IRQ0 input (P20)		IRQ1 input (P21)
0	IRQ0 Noise filter OFF	IRQ1 Noise filter OFF
1	IRQ0 Noise filter ON	IRQ1 Noise filter ON

 Table 3-3-3
 Noise Remove Function

Sampling Cycle Setup (External interrupts 0 and 1)

The sampling cycle of noise remove function can be set by the NFnCKS 1-0 flag of the NFCTR register.

Table 3-3-4	Sampling Cycle /	Time of Noise Remove Function
-------------	------------------	-------------------------------

NFnCKS1	NFnCKS0	Sampling	ampling High-frequency oscillation			
INFIGRO	INFIGROU	cycle	at fosc=	20 MHz	at fosc=	=8 MHz
0	0	fs/2 <sup>2</sup>	2.5 MHz	400 ns	1 MHz	1 µs
0	1	fs/2 <sup>8</sup>	39.06 kHz	25.60 µs	15.62 kHz	64 µs
4	0	fs/2 <sup>9</sup>	19.53 kHz	51.20 µs	7.81 kHz	128 µs
	1	fs/210	9.77 kHz	102.40 µs	3.91 kHz	256 µs

#### ■Noise Remove Function Operation (External interrupts 0 to 1)

After sampling the input signal to the external interrupt pins (IRQ0, IRQ1) by the set sampling time, if the same level comes continuously three times, that level is sent to the inside of LSI. If the same level does not come continuously three times, the previous level is sent. It means that only the signal with the width of more than " Sampling time X 3 sampling clocks " can pass through the noise filter, and other much narrower signals are removed, because those are regarded as noise.

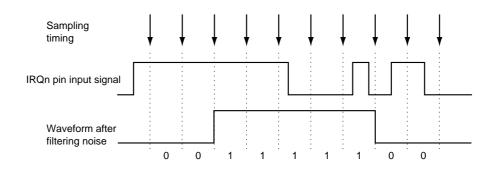

Figure 3-3-7 Noise Remove Function Operation

Noise filter can not be used at STOP mode and HALT mode.

### ■Noise Filter Setup Example (External interrupt 0 and 1)

Noise remove function is added to the input signal from P20 pin to generate the external interrupt 0 (IRQ0) at the rising edge. The sampling clock is set to  $fs/2^2$ , and the operation state is fosc = 20 MHz. An example setup procedure, with a description of each step is shown below.

	Setup Procedure		Description
(1)	Specify the interrupt active edge. IRQ0ICR (x'3FE2') bp5 : REDG0 = 1	(1)	Set the REDG 0 flag of the external interrupt 0 control register (IRQ0ICR) to "1" to specify the interrupt active edge to the rising edge.
(2)	Select the sampling clock. NFCTR (x'3F8A') bp2-1 : NF0CKS1-0 = 00	(2)	Select the sampling clock to $fs/2^2$ by the NF0CKS1-0 flag of the noise filter control register (NFCTR).
(3)	Set the noise filter operation. NFCTR (x'3F8A') bp0 : NF0EN = 1	(3)	Set the NF0EN flag of the NFCTR register to "1" to add the noise filter operation.
(4)	Set the interrupt level. IRQ0ICR (x'3FE2') bp7-6 : IRQ0LV1-0= 10	(4)	Set the interrupt level by the IRQ0LV 1- 0 flag of the IRQ0ICR register. If any interrupt request flag had already been set, clear it. [ Chapter 3 3-1-4. Interrupt flag setup ]
(5)	Enable the interrupt. IRQ0ICR (x'3FE2') bp1 : IRQ0IE = 1	(5)	Set the IRQ0IE flag of the IRQ0ICR register to "1" to enable the interrupt.

Note : The above (2) and (3) are set at the same time.

The input signal from the P20 pin generates the external interrupt 0 at the rising edge of the signal, after passing through the noise filter.

The setup of the noise filter should be done before the interrupt is enabled.

The external interrupt pins are recommended to be pull-up in advance.

### 3-3-7 AC Zero-Cross Detector

This LSI has AC zero-cross detector circuit. The P21 / ACZ pin is the input pin of AC zero-cross detector circuit. AC zero-cross detector circuit output the high level when the input level is at the middle, and outputs the low level at other level.

■AC Zero-Cross Detector (External interrupt 1)

AC zero-cross detector sets the IRQ1 pin to the high level when the input signal (P21/ACZ pin) is at intermediate range. At the other level, IRQ1 pin is set to the low level. AC zero-cross can be detected by setting the P21IM flag of the pin control register (FLOAT1) to "1".

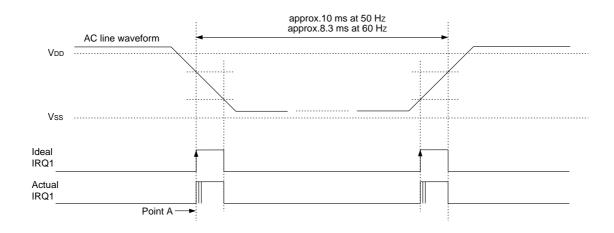

Figure 3-3-8 AC Line Waveform and IRQ1 Generation Timing

Actual IRQ1 interrupt request is generated several times at crossing the 1/2 VDD of AC line waveform. So, the filtering operation by the program is necessary.

If you select the noise filter, the judgement of this program can be easier. But it can not be used for the recover when OSC is stopped at the back up mode.

### ■AC Zero-Cross Detector Setup Example (External interrupt 1)

AC zero-cross detector generates the external interrupt 1 (IRQ1) by using P21/ACZ pin.

The sampling clock is set to  $fs/2^2$ , and the noise filter is used.

An example setup procedure, with a description of each step is shown below.

Setup Procedure			Description
(1)	Select the interrupt edge. IRQ1ICR (x'3FE3') bp5 : REDG1 = 1	(1)	Set the REDG1 flag of the external interrupt 1 control register (IRQ1ICR) to "1" to specify the active edge of the external interrupt to "rising".
(2)	Select the noise filter and its sampling clock. NFCTR (x'3F8A') bp3 : NF1EN = 1 bp5-4 : NF1CKS1-0 = 00	(2)	Select the noise filter by the NF1EN, NFCKS1-0 flag of the noise filter control register (NFCTR). And select fs/2 <sup>2</sup> for its sampling cycle.
(3)	Select the AC zero-cross detector signal. FLOAT1 (x'3F4B') bp2 : P21IM = 1	(3)	Set the P21IM flag of the pin control register 1 (FLOAT1) to "1" to select the AC zero-cross detector signal as the external interrupt 1 generation factor.
(4)	Set the interrupt level. IRQ1ICR (x'3FE3') bp7-6 : IRQ1LV1-0= 10	(4)	Set the interrupt level by the IRQ1LV 1-0 flag of the IRQ1ICR register. If any interrupt request flag had already been set, clear it. [ C Chapter 3 3-1-4. Interrupt flag setup ]
(5)	Enable the interrupt. IRQ1ICR (x'3FE3') bp1 : IRQ1IE = 1	(5)	Set the IRQ1IE flag of the IRQ1ICR register to "1" to enable the interrupt.

When the input signal level from P21/ACZ pin crosses 1/2 VDD, the external interrupt 1 is generated.

# Chapter 4 I/O Ports

4

### 4-1 Overview

### 4-1-1 I/O Port Diagram

A total of 71 pins on this LSI, including those shared with special function pins, are allocated for the 10 I/O ports of ports 0 to 8 and port A. Each I/O port is assigned to its corresponding special function register area in memory. I/O ports are operated in byte or bit units in the same way as RAM.

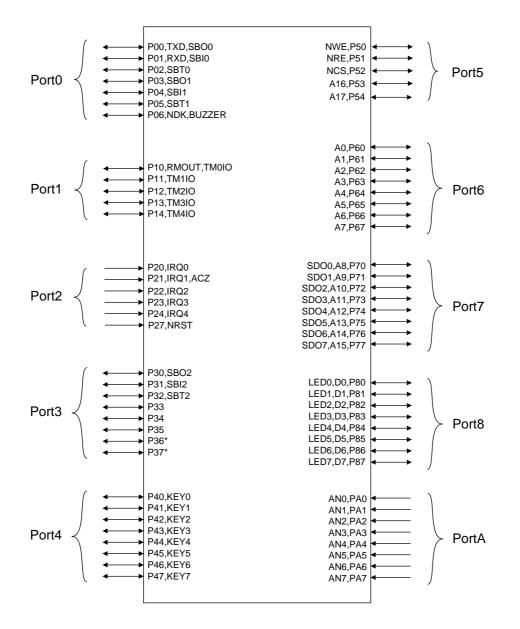

Figure 4-1-1 I/O Port Functions

\*P36 and P37 are not allocated to MN101CF51G.

### 4-1-2 I/O Port Status at Reset

Port Name	I/O mode	Pull-up / Pull-down resistor	I/O port, special functions
Port 0	Input mode	No pull-up resistor	VO port
Port 1	Input mode	No pull-up resistor	VO port
Port 2	Input mode	No pull-up resistor	VO port
Port3	Input mode	No pull-up resistor	VO port
Port4	Input mode	No pull-up resistor	VO port
Port 5	Input mode	No pull-up resistor	VO port
Port 6	Input mode	No pull-up resistor	VO port
Port 7	Input mode	No pull-up / pull-down resistor	VO port
Port 8	Input mode	No pull-up resistor	VO port
Port A	Input mode	No pull-up / pull-down resistor	VO port

Table 4-1-1	I/O Port Status at Reset	(Single chip mode)
-------------	--------------------------	--------------------

### Table 4-1-2 I/O Port Status at Reset (Memory expansion mode and Processor mode)

Port Name	I/O mode	Pull-up / Pull-down resistor	I/O port, special functions	
Port 0	Input mode	No pull-up resistor VO port *		
Port 1	Input mode	No pull-up resistor	VO port	
Port 2	Input mode	No pull-up resistor	VO port	
Port3	Input mode	No pull-up resistor	I/O port	
Port4	Input mode	No pull-up resistor	l/O port	
Port 5	Output mode	NWE, NRE, NCS, A16, A17		
Port 6	Output mode	A0 to A7		
Port 7	Output mode	A8 to A15		
Port 8	Input mode	D0 to D7		
Port A	Input mode	No pull-up / pull-down resistor	VO port	

★ P06 is used as NDK pin (input mode).

### 4-1-3 Control Registers

Ports 0 to 8 and A are controlled by the data output register (PnOUT), the data input register (PnIN), the I/O direction control register (PnDIR), the pull-up resistor control register (PnPLU) and the pull-up / pull-down resistor control resister (PnPLUD) and registers (SYSMD, P1OMD, PAIMD, P4IMD, EXADV, FLOAT1, FLOAT2) that control special function pin.

This I/O control is valid at selection of the special function, as well. But if the processor mode is set, P06, P50 to P54, P60 to P67, P70 to P77 and P80 to P87 cannot be I/O controlled by register setting.

Table 4-1-3 shows the registers to control ports 0 to 8 and A;

	Register	Address	R/W	Function	Page
Port 0	POOUT	x'03F10'	R/W	Port 0 output register	IV-7
	POIN	x'03F20'	R	Port 0 input register	IV-7

### Table 4-1-4 I/O Port Control Registers List (2/2)

# 4-2 Port 0

### 4-2-1 Description

### ■General Port Setup

Each bit of the port 0 control I/O direction register (P0DIR) can be set individually to set pins as input or output. The control flag of the port 0 direction control register (P0DIR) should be set to "1" for output mode, and "0" for input mode.

To read input data of pin, set the control flag of the port 0 direction control register (P0DIR) to "0" and read the value of the port 0 input register (P0IN).

To output data to pin, set the control flag of the port 0 direction control register (P0DIR) to "1" and write the value of the port 0 output register (P0OUT).

Each pin can be set individually if pull-up resistor is added or not, by the port 0 pull-up resistor control register (P0PLU). Set the control flag of the port 0 pull-up resistor control register (P0PLU) to "1" to add pull-up resistor.

At reset, the input mode is selected and pull-up resistors are disabled (high impedance output).

### ■Special Function Pin Setup

P00 to P02 are used as I/O pin for serial interface 0, as well. P00 is output pin of the serial interface 0 transmission data, and UART transmission data. When the SC0SBOS flag of the serial interface 0 mode register 3 (SC0MD3) is "1", P00 is serial data output pin. P01 is the input pin of the serial interface 0 reception data, and UART reception data. When the SC0SBIS flag of the serial interface 0 mode register 3 (SC0MD3) is "1", P01 is serial data input pin. P02 is I/O pin of the serial interface 0 clock. When the SC0SBTS flag of serial interface 0 mode register 3 (SC0MD3) is "1", P01 is serial data input pin. P02 is I/O pin of the serial interface 0 clock. When the SC0SBTS flag of serial interface 0 mode register 3 (SC0MD3) is "1", P02 is serial interface clock output pin.

P00 and P02 can be selected as either an push-pull output or Nch open-drain output by the SC0SBOM and the SC0SBTM of the serial interface 0 mode register 3 (SC0MD3).

[ Chapter 10 10-2. Control registers ]

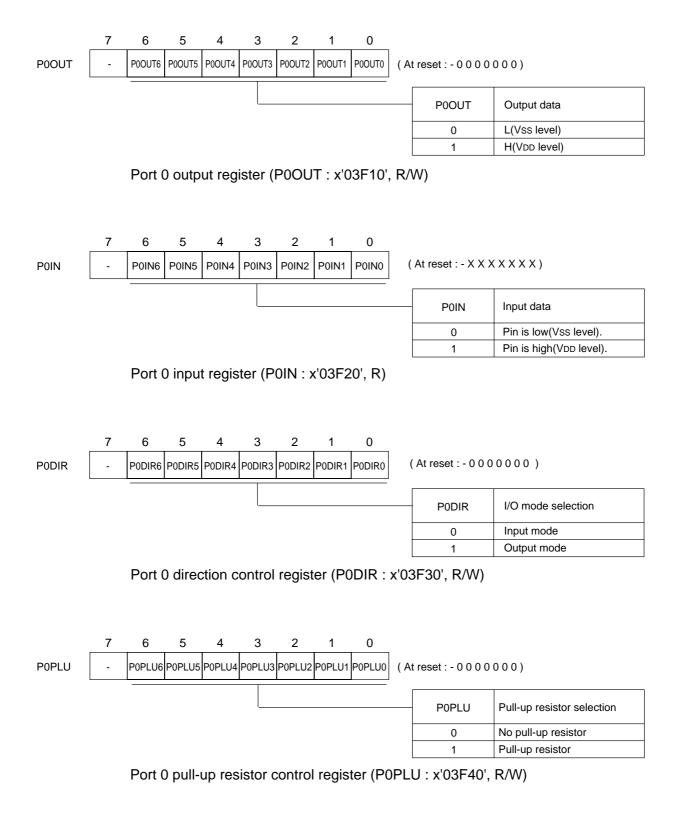

P03 to P05 are used as I/O pin for serial interface 1, as well. P03 is output pin of the serial interface 1 transmission data. When the SC1SBOS flag of the serial interface 1 mode register 1 (SC1MD1) is "1", P03 is serial data output pin. P04 is the serial interface 1 reception data input pin. When the SC1SBIS flag of the serial interface 1 mode register 1 (SC1MD1) is "1", P04 is serial data input pin. P05 is I/O pin of the serial interface 1 clock. When the SC1SBTS flag of serial interface 1 mode register 1 (SC1MD1) is "1", P05 is serial interface clock output pin.

P03 and P05 can be selected as either an push-pull output or Nch open-drain output by the SC1SBOM and the SC1SBTM of the serial interface 1 mode register 1 (SC1MD1).

[ C Chapter 11 11-2. Control registers ]

P06 is used as a buzzer output pin, as well. When the bp7 of the oscillation stabilization control register (DLYCTR) is "1", buzzer output is enabled. In processor mode or memory expansion mode, data acknowledge mode input pin (NDK) is selected. In those mode, input mode is always selected.

### 4-2-2 Registers

### 4-2-3 Block Diagram

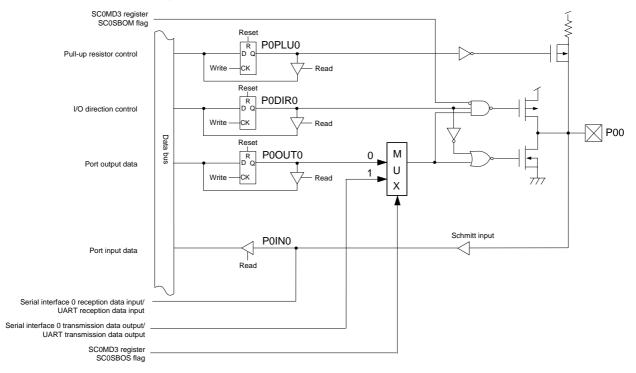

Figure 4-2-2 Block diagram (P00)

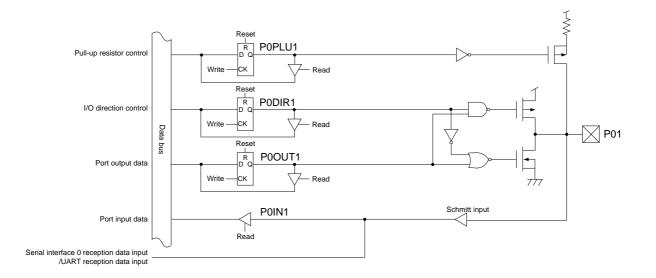

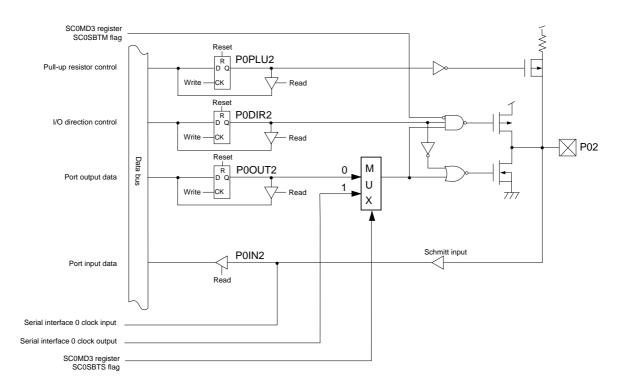

Figure 4-2-3 Block diagram (P01)

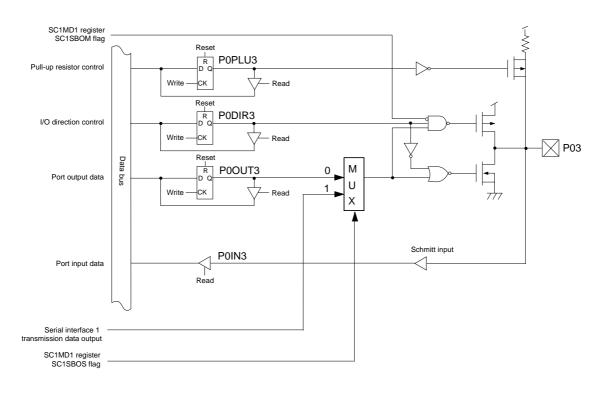

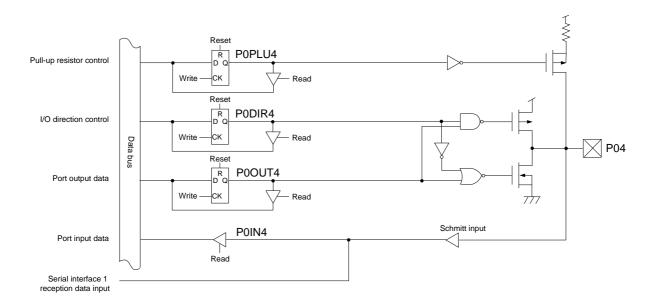

Figure 4-2-5 Block diagram (P03)

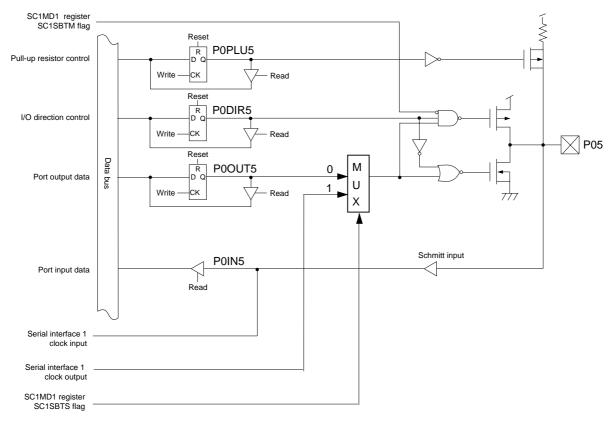

Figure 4-2-7 Block Diagram (P05)

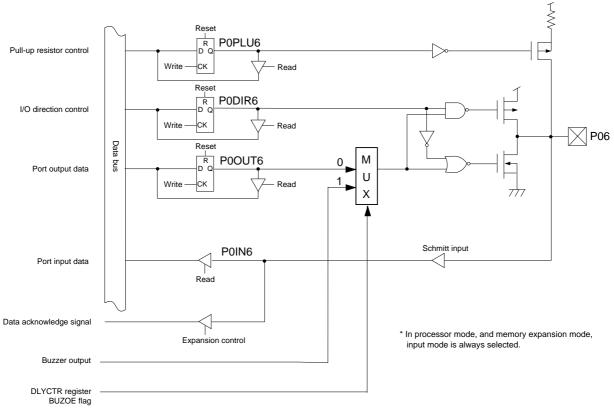

Figure 4-2-8 Block Diagram (P06)

In memory expansion mode, P06 pin is used for NDK pin even if the handshake mode is not used. So P06 cannot be used for general input pin or buzzer output.

# 4-3 Port 1

### 4-3-1 Description

#### ■General Port Setup

Each bit of the port 1 control I/O direction register (P1DIR) can be set individually to set pins as input or output. The control flag of the port 1 direction control register (P1DIR) should be set to "1" for output mode, and "0" for input mode.

To read input data of pin, set the control flag of the port 1 direction control register (P1DIR) to "0" and read the value of the port 1 input register (P1IN).

To output data to pin, set the control flag of the port 1 direction control register (P1DIR) to "1" and write the value of the port 1 output register (P1OUT).

Each pin can be set individually if pull-up resistor is added or not, by the port 1 pull-up resistor control register (P1PLU). Set the control flag of the port 1 pull-up resistor control register (P1PLU) to "1" to add pull-up resistor.

At reset, the input mode is selected and pull-up resistors are disabled (high impedance output).

#### ■Special Function Pin Setup

P10 to P14 are used as timer I/O pin, as well. P10 is used as remote control carrier output pin, as well. The port 1 output mode register (P1OMD) can select P10 to P14 output mode by each bit. When the port 1 output mode register (P1OMD) is "1", special function data is output, and when it is "0", they are used as general port.

Port 1 output mode register (P1OMD : x'03F39', R/W)

\* The TM0RM flag of the RMCTR register switches the remote control output and the timer output.

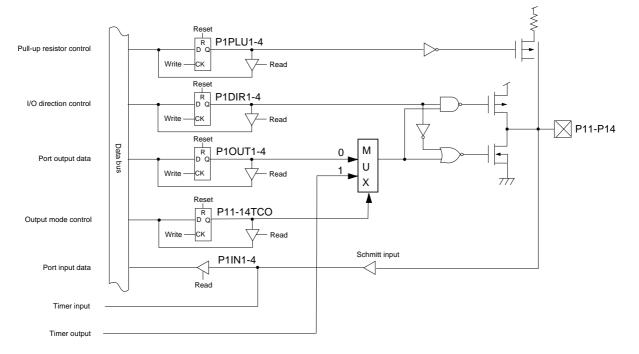

Figure 4-3-3 Block Diagram (P10)

# 4-4 Port 2

### 4-4-1 Description

#### ■General Port Setup

Port 2 is input port, except P27. To read input data of pin, read out the value of the port 2 input register (P2IN).

P27 is reset pin. When the software is reset, write the bp7 of the port 2 output register (P2OUT) to "0".

The port 2 pull-up resistor control register (P2PLU) can select if port 2 is added pull-up resistor or not, by each bit. When the control flag of the port 2 pull-up resistor control register (P2PLU) is set to "1", pull-up resistor is added. P27 is always added pull-up resistor.

Special Function Pin SetupP20 to P24 are used as external interrupt pins, as well.

P21 is used as an input pin for external interrupt and AC zero-cross. To read data of AC zero-cross, set the bp2 of the pin control register (FLOAT1) to "1" and read the value of the port 2 input register (P2IN).

## 4-5 Port 3

## 4-5-1 Description

#### ■General Port Setup

Each bit of the port 3 control I/O direction register (P3DIR) can be set individually to set pins as input or output. The control flag of the port 3 direction control register (P3DIR) should be set to "1" for output mode, and "0" for input mode.

To read input data of pin, set the control flag of the port 3 direction control register (P3DIR) to "0" and read the value of the port 3 input register (P3IN).

To output data to pin, set the control flag of the port 3 direction control register (P3DIR) to "1" and write the value of the port 3 output register (P3OUT).

Each pin can be set individually if pull-up resistor is added or not, by the port 3 pull-up resistor control register (P3PLU). Set the control flag of the port 3 pull-up resistor control register (P3PLU) to "1" to add pull-up resistor.

At reset, the input mode is selected and pull-up resistors are disabled (high impedance output).

#### ■Special Function Pin Setup

P30 to P32 are used as I/O pin for serial interface 2, as well. P30 is output pin of the serial interface 2 transmission data. When the SC2SBOS flag of the serial interface 2 mode register 1 (SC2MD1) is "1", P30 is serial data output pin. P31 is the input pin of the serial interface 2 reception data. When the SC2SBIS flag of the serial interface 2 mode register 1 (SC2MD1) is "1", P31 is serial data input pin. P32 is I/O pin of the serial interface 2 clock. When the SC2SBTS flag of serial interface 2 mode register 1 (SC2MD1) is "1", P32 is serial interface clock output pin.

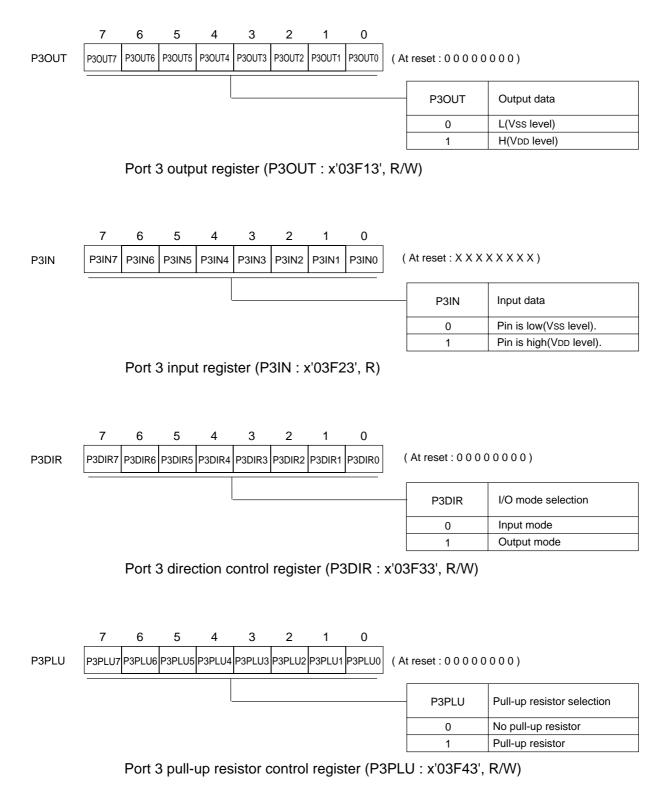

P30 and P32 can be selected as either an push-pull output or Nch open-drain output by the SC2SBOM and the SC2SBTM of the serial interface 2 mode register 1 (SC2MD1).

## 4-6 **Port 4**

### 4-6-1 Description

#### ■General Port Setup

Each bit of the port 4 control I/O direction register (P4DIR) can be set individually to set pins as input or output. The control flag of the port 4 direction control register (P4DIR) should be set to "1" for output mode, and "0" for input mode.

To read input data of pin, set the control flag of the port 4 direction control register (P4DIR) to "0" and read the value of the port 4 input register (P4IN).

To output data to pin, set the control flag of the port 4 direction control register (P4DIR) to "1" and write the value of the port 4 output register (P4OUT).

Each pin can be set individually if pull-up resistor is added or not, by the port 4 pull-up resistor control register (P4PLU). Set the control flag of the port 4 pull-up resistor control register (P4PLU) to "1" to add pull-up resistor.

At reset, the input mode is selected and pull-up resistors are disabled (high impedance output).

#### ■Special Function Pin Setup

P40 to P47 are also used as input pins for key initerrupt.

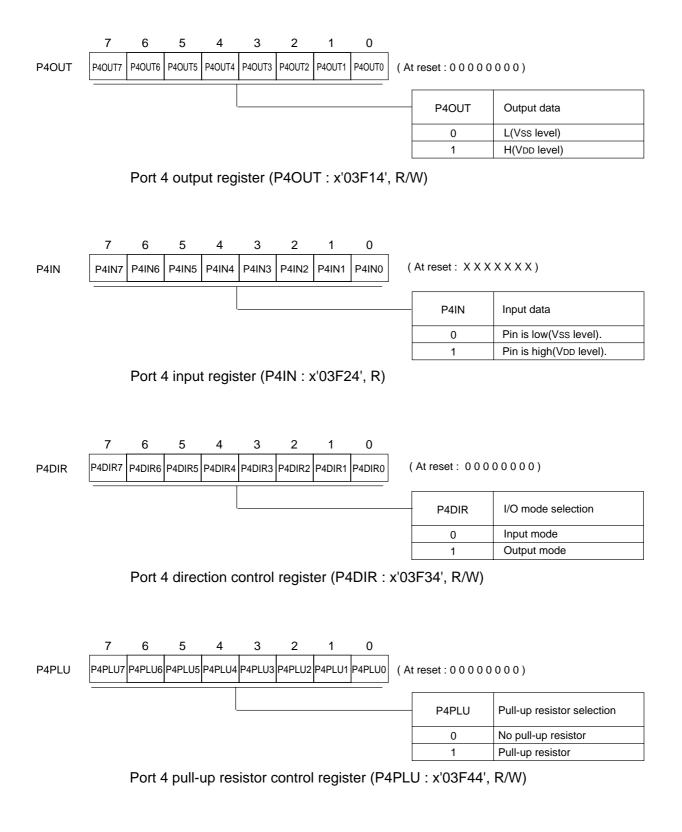

Key interrupt pin should be pull-up pin in advance.

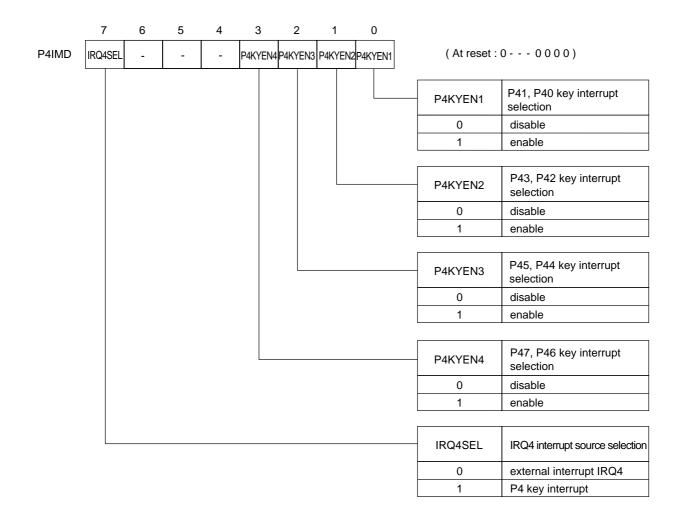

When key input interrupt is used, set the REDG4 flag of the external input 4 control register (IRQ4ICR) to "0" (falling edge).

## 4-6-2 Registers

## 4-7 Port 5

### 4-7-1 Description

#### ■General Port Setup

Each bit of the port 5 control I/O direction register (P5DIR) can be set individually to set pins as input or output. The control flag of the port 5 direction control register (P5DIR) should be set to "1" for output mode, and "0" for input mode.

To read input data of pin, set the control flag of the port 5 direction control register (P5DIR) to "0" and read the value of the port 5 input register (P5IN).

To output data to pin, set the control flag of the port 5 direction control register (P5DIR) to "1" and write the value of the port 5 output register (P5OUT).

Each pin can be set individually if pull-up resistor is added or not, by the port 5 pull-up resistor control register (P5PLU). Set the control flag of the port 5 pull-up resistor control register (P5PLU) to "1" to add pull-up resistor.

At reset in single chip mode, the P50 to P54 input mode is selected and pull-up resistors are disabled (high impedance output). In processor mode, NWE, NRE, NCS, A16 and A17 are selected.

#### ■Special Function Pin Setup

In processor mode or memory expansion mode, P50 to P52 are output pins for control signal to the expansion memory. In those mode, output mode is always selected.

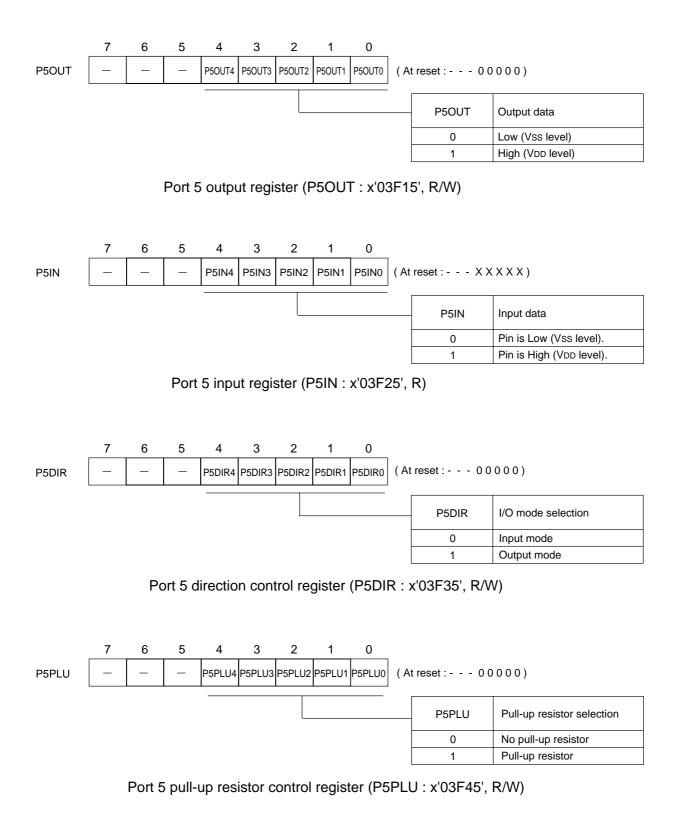

In processor mode or memory expansion mode, P53 and P54 are output pins for address to the expansion memory. But in memory expansion mode, the bp7 of the address output control register (EXADV) set if they are used as address output pins or general I/O pins.

Pins	In processor mode

## 4-8 **Port 6**

### 4-8-1 Description

#### ■General port Setup

Each bit of the port 6 control I/O direction register (P6DIR) can be set individually to set pins as input or output. The control flag of the port 6 direction control register (P6DIR) should be set to "1" for output mode, and "0" for input mode.

To read input data of pin, set the control flag of the port 6 direction control register (P6DIR) to "0" and read the value of the port 6 input register (P6IN).

To output data to pin, set the control flag of the port 6 direction control register (P6DIR) to "1" and write the value of the port 6 output register (P6OUT).

Each pin can be set individually if pull-up resistor is added or not, by the port 6 pull-up resistor control register (P6PLU). Set the control flag of the port 6 pull-up resistor control register (P6PLU) to "1" to add pull-up resistor.

At reset in single chip mode, the P60 to P67 input mode is selected and pull-up resistors are disabled (high impedance output). In processor mode, A0 to A7 output mode are selected.

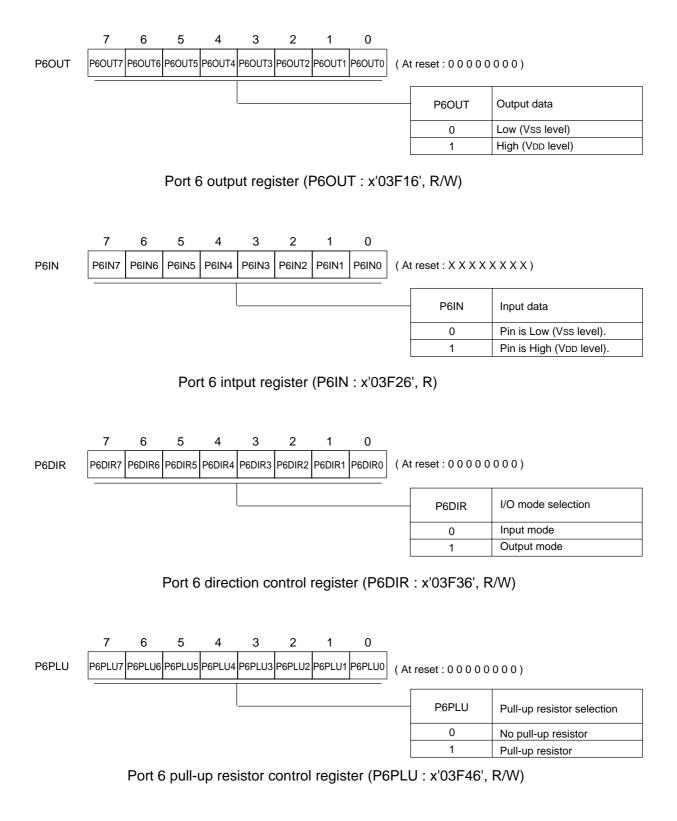

#### ■Special Function Pin Setup

In processor mode or memory expansion mode, P60 to P67 are output pins to the expansion memory. In those mode, any register cannot control input or output. Only at access to the expansion memory, address is output, and during other period (at NCS = "H") it is high impedance state (input mode).

Pins	In processor mode In memory expansion mode	
P60	A0 (External memory address bp0)	
P61	A1 (External memory address bp1)

## 4-8-2 Registers

## 4-8-3 Block Diagram

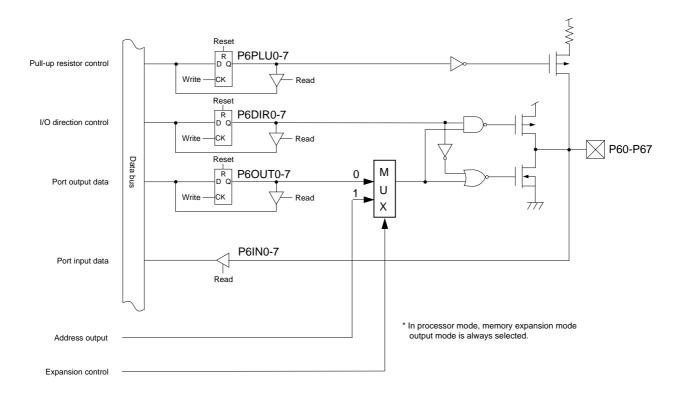

Figure 4-8-2 Block Diagram (P60 to P67)

# 4-9 Port 7

### 4-9-1 Description

#### ■General Port Setup

Each bit of the port 7 control I/O direction register (P7DIR) can be set individually to set pins as input or output. The control flag of the port 7 direction control register (P7DIR) should be set to "1" for output mode, and "0" for input mode.

To read input data of pin, set the control flag of the port 7 direction control register (P7DIR) to "0" and read the value of the port 7 input register (P7IN).

To output data to pin, set the control flag of the port 7 direction control register (P7DIR) to "1" and write the value of the port 7 output register (P7OUT).

Each pin can be set individually if pull-up / pull-down resistor is added or not, by the port 7 pull-up / pulldown resistor control register (P7PLUD). But pull-up / pull-down cannot be mixed. Set the control flag of the port 7 pull-up / pull-down resistor control register (P7PLUD) to "1" to add pull-up or pull-down resistor. The pin control register 1 (FLOAT1) select if pull-up resistor or pull-down resistor is added. The bp0 of the pin control register 1 (FLOAT1) is set to "1" for pull-down resistor, set to "0" for pull-up resistor.

At reset in single chip mode, the P70 to P77 input mode is selected and pull-up resistors are disabled (high impedance output). In processor mode, A8 to A15 (address signal) output mode are selected.

#### ■Special Function Pin Setup

The synchronous output control register (SYSMD) selects the synchronous output pin of the port 7, in each bit. When the SYSMD is "1", it can be used for synchronous output, and when it is "0", it can be used for general port. The synchronous output event is selected by the pin control register 2 (FLOAT2). When the bp1, bp0 of the FLOAT2 are "00", the external interrupt 2 (IRQ2) is selected, and "01" for the timer 4 interrupt, and "10" for the timer 2 interrupt, and "11" for the timer 1 interrupt. For more detail, refer to **4-12 Synchronous output [p. IV-49]**.

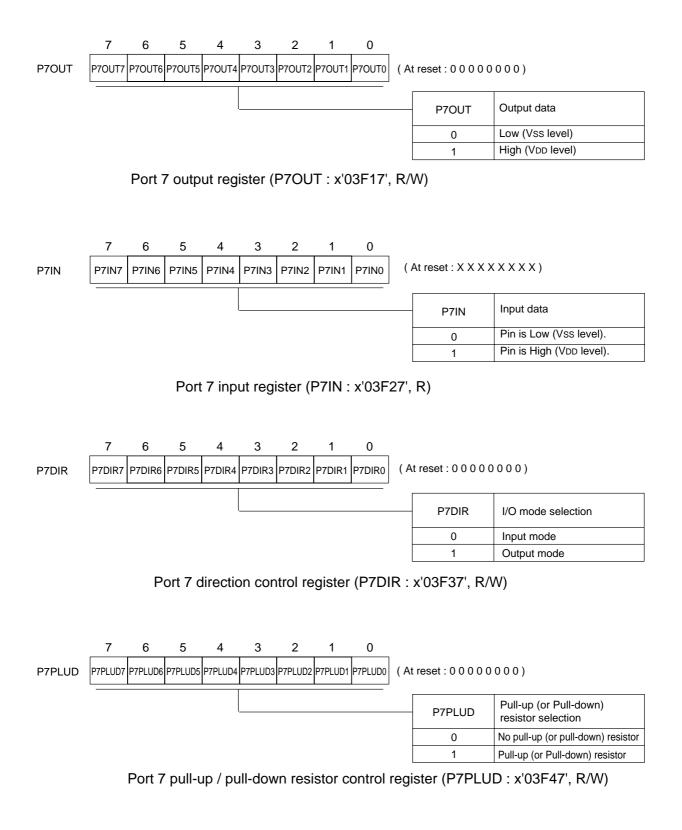

In processor mode or memory expansion mode, P70 to P77 are output pins to the expansion memory. But in memory expansion mode, the bp5 or bp6 of the address output control register (EXADV) set if they are used as address output pins or general I/O pins.

Pins	In processor mode In memory expansion mode *	
P70	A8 (External memory address bp8)	
P71	A9 (External memory address bp9)	
P72	A10 (External memory address bp10)	
P73	A11 (External memory address bp11)	
P74	A12 (External memory address bp12)	
P75	A13 (External memory address bp13)	
P76	A14 (External memory address bp14)	
P77	A15 (External memory address bp15)	

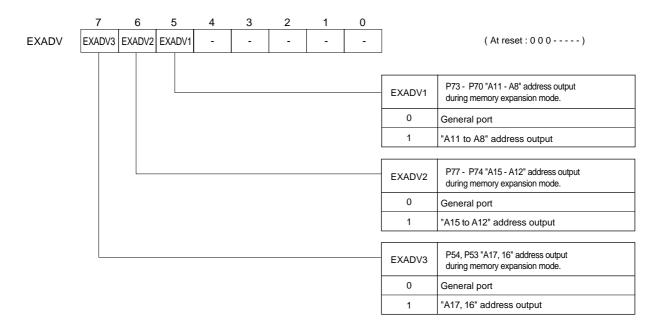

Table 4-9-1	Expansion Pins (P70 to P77)
-------------	-----------------------------

\* In memory expansion mode, the bp5, 6 of the EXADV register should be set to "1" for P70 to P77 output address.

## 4-10-1 Description

#### ■General Port Setup

Each bit of the port 8 control I/O direction register (P8DIR) can be set individually to set pins as input or output. The control flag of the port 8 direction control register (P8DIR) should be set to "1" for output mode, and "0" for input mode.

To read input data of pin, set the control flag of the port 8 direction control register (P8DIR) to "0" and read the value of the port 8 input register (P8IN).

To output data to pin, set the control flag of the port 8 direction control register (P8DIR) to "1" and write the value of the port 8 output register (P8OUT).

Each pin can be set individually if pull-up resistor is added or not, by the port 8 pull-up resistor control register (P8PLU). Set the control flag of the port 8 pull-up resistor control register (P8PLU) to "1" to add pull-up resistor.

At reset in single chip mode, the P80 to P87 input mode is selected and pull-up resistors are disabled (high impedance output). In processor mode, D0 to D8 (data signal) high impedance output mode are selected.

■ Special Function Pin Setup

P80 to P87 are used as LED driving pins, as well.

In processor mode or memory expansion mode, P80 to P87 are I/O pins to the expansion memory. In those mode, any register cannot control input or output.

Pins	In processor mode In memory expansion mode

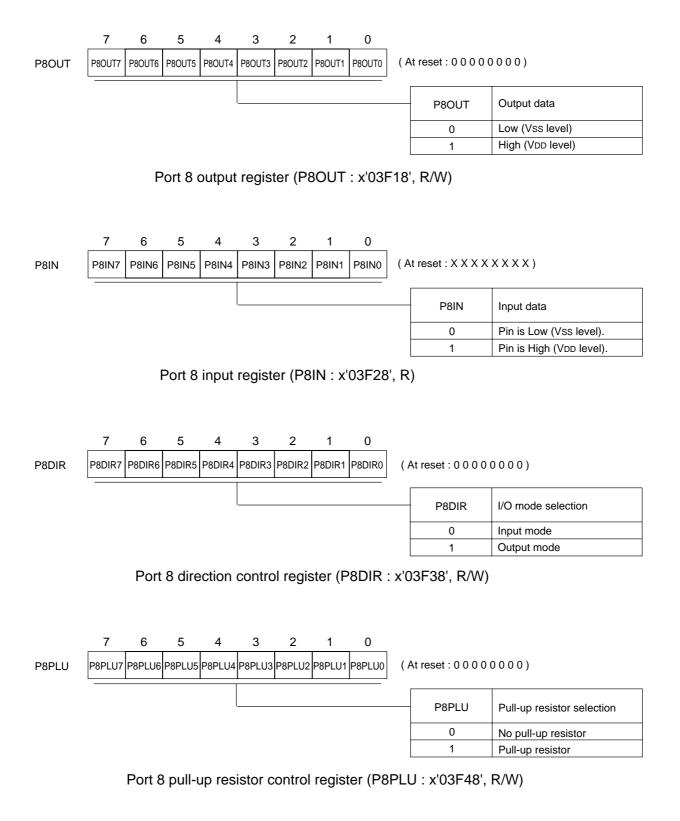

Figure 4-10-1 Port 8 Registers

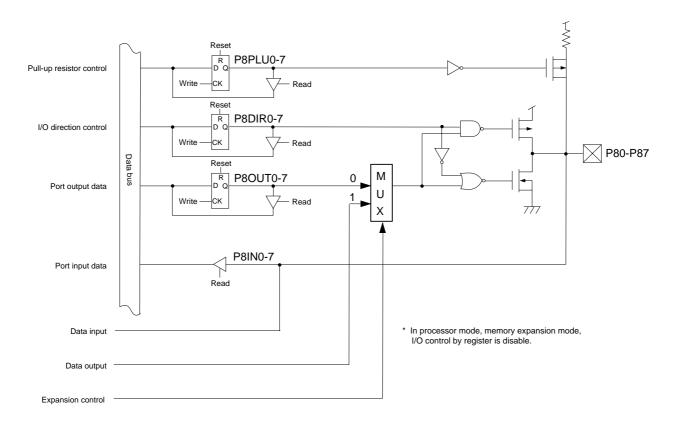

Figure 4-10-2 Block Diagram (P80 to P87)

# 4-11 Port A

### 4-11-1 Description

#### ■General Port Setup

Port A is input port. To read input data of pin, read the value of the port A input register (PAIN).

Each pin can be set individually if pull-up / pull-down resistor is added or not, by the port A pull-up / pulldown resistor control register (PAPLUD). But pull-up / pull-down cannot be mixed. Set the control flag of the port A pull-up / pull-down resistor control register (PAPLUD) to "1" to add pull-up or pull-down resistor. The pin control register 1 (FLOAT1) select if pull-up resistor or pull-down resistor is added. The bp1 of the FLOAT1 is set to "1" for pull-down resistor, and set to "0" for pull-up resistor.

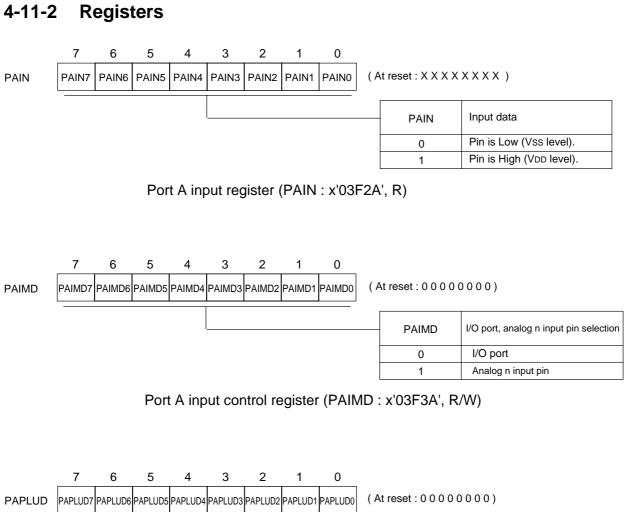

At reset, the PA0 to PA7 input mode is selected and pull-up resistors are disabled.

#### ■Special Function Pin Setup

PA0 to PA7 are used as input pins for analog. Each bit can be set individually as an input by the port A input mode register (PAIMD). When they are used as analog input pins, set the port A input mode register (PAIMD) to "1". Then, the value of the port A input register (PAIN) is "1".

By setting the control flag of the PAIMD register to "1", the through current is not occurred when input voltage is at intermediate level.

### 4-12-3 Operation

■Synchronous Output Setup

The synchronous output control register (SYSMD) selects the synchronous output pin of the port 7, in each bit.

The synchronous output event is selected by the pin control register 2 (FLOAT2).

		Page
Synchronous output port	Port 7	IV - 36
	External interrupt 2 (IRQ2)	III - 19, 34
Output event	Timer 1	V - 29
Oupurevent	Timer 2	V - 29
	Timer 4	VI - 24

 Table 4-12-2
 Synchronous Output Event

When the external interrupt 2 (IRQ2) is selected, the interrupt edge should be specified. The interrupt edge can be specified by the external interrupt 2 control register (IRQ2ICR). The synchronous output recognizes the generation of the specified edge as an event.

#### Synchronous Output Operation

When the synchronous output control register (SYSMD) is set to disable the synchronous output (I/O port), the port 7 is functioned as a general port. (Figure 4-12-1. Block Diagram)

After the output mode is selected by the port 7 direction control register (P7DIR), if the synchronous output is enabled by the synchronous output control register (SYSMD), the value of the synchronous output value stored register is output from pins. If the synchronous output event that is set by the pin control register 2 (FLOAT2) is never generated, the synchronous output value stored register holds the same value when the synchronous output event is enabled.

Store the value that should be output from pin after the synchronous output event is generated, to the port 7 output register (P7OUT). Once the synchronous output event that is set by the pin control register 2 (FLOAT2) is generated, the data of the synchronous output value stored register is switched to the data of the port 7 output register (P7OUT), and the output value from pin is changed.

When the port 7 synchronous output is disabled, the value of the synchronous output value stored register is not always same to the value of the port 7 output register (P7OUT). Therefore, the pin output may be changed at switching from general output to synchronous output.

#### ■Port 7 Synchronous Output (External interrupt 2 IRQ2)

The synchronous output timing when the synchronous output event is set at the falling edge of the external interrupt 2, is shown below. The latched data on port 7 is output in synchronization with the falling edge of the IRQ2.

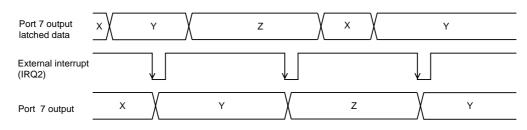

Figure 4-12-2 Synchronous Output Timing by Event Generation (IRQ2)

#### ■Port 7 Synchronous Output (Timers 1, 2, and 4)

The timer interrupt flag TMnIRQ is generated when binary counter and compare register are matched. The latched data on port 7 is output from the port 7 in synchronization with the rising edge of the TMnIRQ. About the setting of each timer operation, refer to chapter 5. 8-Bit timers and chapter 6. 16-Bit timers.

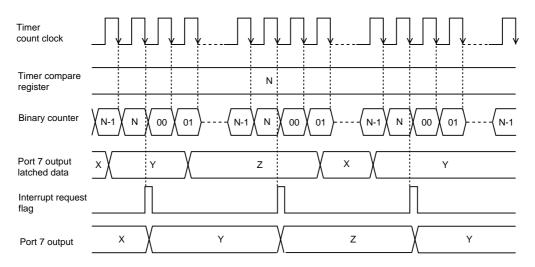

Figure 4-12-3 Synchronous Output Timing by Event Generation (Timers 1, 2 and 4)

### 4-12-4 Setup Example

A setup example of the port 7 synchronous output by the external interrupt 2 (IRQ2) is shown as follows. As it is operated, the initial output data of port 7 is "55", the synchronous output data is "AA", and the rising edge of the IRQ2 is selected at the synchronous event.

An example setup procedure, with description of each step is shown below.

Setup Procedure	Description
<ul> <li>(1) Select the synchronous output event.</li> <li>FLOAT2 (x'3F4C')</li> <li>bp1-0 :P7SYEVS1-0 = 00</li> </ul>	<ol> <li>Set the P7SYEVS1-0 flag of the FLOAT2 register to "00" to set the synchronous output event to the IRQ2.</li> </ol>
<ul> <li>(2) Specify the interrupt edge.</li> <li>IRQ2ICR(x'3FEB')</li> <li>bp5 : REDG2 = 1</li> </ul>	(2) Set the REDG2 flag of the IRQ2ICR register to "1" to set the active edge of the IRQ2 at the rising edge.
<ul> <li>(3) Set the initial output data.</li> <li>P7OUT(x'3F17')</li> <li>bp7-0 : P7OUT7-0 = x'55'</li> <li>P7DIR(x'3F37')</li> <li>bp7-0 : P7DIR7-0 = x'FF'</li> </ul>	(3) Set the initial output data "55" to the P7OUT register. Select output mode after the P7DIR7-0 flag of the P7DIR register is set to "FF". Port 7 outputs "55".
<ul> <li>(4) Set the synchronous output pin.</li> <li>SYSMD(x'3F1F')</li> <li>bp7-0 : SYSMD7-0 = x'FF'</li> </ul>	(4) Port 7 is set to synchronous output pin by setting the SYSMD7-0 flag of the SYSMD register to "FF".
<ul> <li>(5) Set the synchronous output data.</li> <li>P7OUT(x'3F17')</li> <li>bp7-0 : PDOUT7-0 = x'AA'</li> </ul>	(5) Set the synchronous output data "AA" to the P7OUT register.
(6) Event is generated. Rising edge is generated at P22.	(6) Port 7 outputs "AA" at the rising edge of IRQ2.

# Chapter 5 8-Bit Timers

# 5-1 Overview

This LSI contains three general purpose 8-bit timers (Timers 0, 1 and 2) and one 8-bit timer (Timers 3) that can be also used as baud rate timer. Timers 0,1 and timers 2, 3 can be used as 16-bit timers with cascade connection.

### 5-1-1 Functions

Table 5-1-1 shows functions of each timer.

	Timer 0 (8 bit)	Timer 1 (8 bit)	Timer 2 (8 bit)	Timer 3 (8 bit)	Timer 5 * (8 bit)
Interrupt source	TM0IRQ	TM1IRQ	TM2IRQ	TM3IRQ	TM5IRQ
Timer operation		$\checkmark$			$\checkmark$
Event count					-
Timer pulse output					-
PWM output		-		-	-
Synchronous output	-			-	-
Serial transfer clock output	√ (SIF2)	-	-	√ (SIF0,1)	-
Cascade connection	۲	V	٦	l l	-
Remote control carrier output	V	-	-		-
Clock source	fosc fs fs/4 TM0IO input	fs/16 fs/64 fx TM1IO input	fs fs/4 fx TM2IO input	fosc fs/4 fs/16 TM3IO input	fosc fs/4 fx fosc/2 <sup>13</sup> fx/2 <sup>13</sup>

#### Table 5-1-1 Timer Functions

fosc : Machine clock (High speed oscillation )

fx : Machine clock (Low speed oscillation )

fs : System clock (at NORMAL mode : fs=fosc/2, at SLOW mode : fs=fx/4)

- When timer 3 is used as a baud rate timer for serial interface function, it is not used as a general timer.

\* Description of timer 5 is shown in Chapter 7.

R/W : Readable / Writable

R : Readable only

### 5-2-2 Programmable Timer Registers

Each of timers 0 to 3 has 8-bit programmable timer registers. Programmable timer register consists of compare register and binary counter.

Compare register is 8-bit register which stores the value to be compared to binary counter.

Binary counter is 8-bit up counter. If any data is written to compare register during counting is stopped, binary counter is cleared to x'00'.

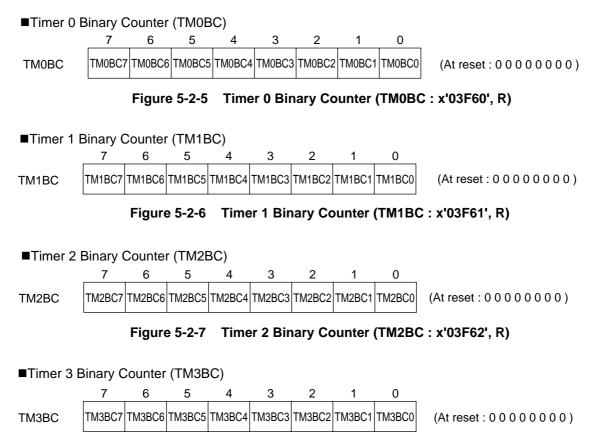

Figure 5-2-8 Timer 3 Binary Counter (TM3BC : x'03F63', R)

### 5-2-3 Timer Mode Registers

Timer mode register is readable/writable register that controls timers 0 to 3.

#### ■Timer 0 Mode Register (TM0MD)

# 5-3 8-Bit Timer Count

### 5-3-1 Operation

The timer operation can constantly generate interrupts.

■8-Bit Timer Operation (Timers 0, 1, 2 and 3)

The generation cycle of timer interrupts is set by the clock source selection and the setting value of the compare register (TMnOC), in advance. If the binary counter (TMnBC) reaches the setting value of the compare register, an interrupt is generated at the next count clock, then binary counter is cleared and counting is restarted from x'00'.

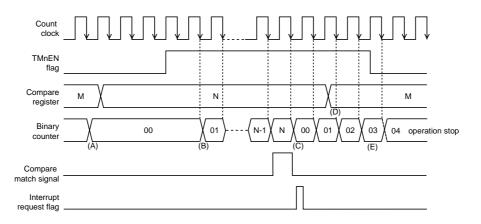

Table 5-3-1 shows clock source that can be selected.

Clock source	1 count time	Timer 0 (8 Bit)	Timer 1 (8 Bit)	Timer 2 (8 Bit)	Timer 3 (8 Bit)
fosc	50 ns	$\checkmark$	-	-	$\checkmark$
fs	100 ns	$\checkmark$	-	$\checkmark$	-
fs/4	400 ns	$\checkmark$	-	$\checkmark$	$\checkmark$
fs/16	1.6 µs	-	$\checkmark$	-	$\checkmark$
fs/64	6.4 µs	-	$\checkmark$	-	-
fx	30.5 µs	-	$\checkmark$	$\checkmark$	-
Notes : as fosc =	20 MHz fx = 32.768	kHz fs = fo	sc/2 = 10 M	Hz	

Table 5-3-1 Clock Source (Timers 0, 1, 2 and 3) at Timer Operation

#### ■Count Timing of Timer Operation (Timers 0, 1, 2 and 3)

Binary counter counts up with selected clock source as a count clock. The basic operation of the whole function of 8-bit timer is as follows ;

#### Figure 5-3-1 Count Timing of Timer Operation (Timers 0, 1, 2 and 3)

- (A) If the value is written to the compare register during the TMnEN flag is "0", the binary counter is cleared to x'00', at the writing cycle.
- (B) If the TMnEN flag is "1", the binary counter is started to count. The counter starts to count up at the falling edge of the count clock. But the binary counter doesn't count up at the first falling of the count edge.
- (C) If the binary counter reaches the value of the compare register, the interrupt request flag is set at the next count clock, then the binary counter is cleared to x'00' and the counting is restarted.
- (D) Even if the compare register is rewritten during the TMnEN flag is "1", the binary counter is not changed.
- (E) If the TMnEN flag is "0", the binary counter is stopped <u>after 1 count up</u>.

When the binary counter reaches the value in the compare register, the interrupt request flag is set and the binary counter is cleared, at the next count clock. So, set the compare register as : Compare register setting = (count till the interrupt request - 1)

If the compare register is set the smaller than the binary counter during the count operation, the binary counter counts up to the overflow, at first.

If the interrupt is enabled, the timer interrupt request flag should be cleared before timer operation is started.

Even if the TMnEN flag of the timer is cleared during operation, it does not stop until the next count clock. Therefore, during max. 1 count clock after the TMnEM is cleared, the binary counter cannot be initialized.

### 5-3-2 Setup Example

#### ■Timer Operation Setup Example (Timers 0, 1, 2 and 3)

Timer function can be set by using timer 0 that generates the constant interrupt. By selecting fs/4 (at fosc = 20 MHz) as a clock source, interrupt is generated every 250 clock cycles (100  $\mu$ s). An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul><li>(1) Stop the counter.</li><li>TM0MD (x'3F80')</li><li>bp4 :TM0EN = 0</li></ul>	(1) Set the TM0EN flag of the timer 0 mode register (TM0MD) to "0" to stop the counting of timer 0.
<ul> <li>(2) Select the normal timer operation. TM0MD (x'3F80')</li> <li>bp3 :TM0PWM = 0</li> </ul>	(2) Set the TM0PWM flag of the TM0MD register to "0" to select the normal timer operation.
<ul><li>(3) Select the count clock source.</li><li>TM0MD (x'3F80')</li><li>bp2-0 :TM0CK2-0 = 010</li></ul>	(3) Select fs/4 to the clock source by the TM0CK2-0 flag of the TM0MD register.
<ul> <li>(4) Set the cycle of the interrupt generation.</li> <li>TM0OC (x'3F70') = x'F9'</li> </ul>	<ul> <li>(4) Set the value of the interrupt generation cycle to the timer 0 compare register (TM0OC). The cycle is 250, so that the setting value is set to 249 (x'F9').</li> <li>At that time, the timer 0 binary counter (TM0BC) is initialized to x'00'.</li> </ul>
<ul><li>(5) Set the interrupt level.</li><li>TM0ICR (x'3FE4')</li><li>bp7-6 :TM0LV1-0 = 10</li></ul>	<ul> <li>(5) Set the interrupt level by the TM0LV1-0 flag of the timer 0 interrupt control register (TM0ICR). If any interrupt request flag had already been set, clear it.</li> <li>[ CP Chapter 3 3-1-4. Interrupt flag setting ]</li> </ul>
<ul> <li>(6) Enable the interrupt.</li> <li>TM0ICR (x'3FE4')</li> <li>bp1 :TM0IE = 1</li> </ul>	<ul><li>(6) Set the TM0IE flag of the TM0ICR register to "1" to enable the interrupt.</li></ul>

Setup Procedure	Description
<ul> <li>(7) Start the timer operation.</li> <li>TM0MD (x'3F80')</li> <li>bp4 :TM0EN = 1</li> </ul>	<ul><li>(7) Set the TM0EN flag of the TM0MD register to "1" to start the timer 0.</li></ul>

The TM0BC starts to count up from 'x00'. When the TM0BC reaches the setting value of the TM0OC register, the timer 0 interrupt request flag is set at the next count clock, then the value of the TM0BC becomes x'00' and restart to count up.

When the TMnEN flag of the TMnMD register is changed at the same time to other bit, binary counter may count up by the switching operation.

The initial value of the TM1CK2-0 in the TM1MD register is indefinite. When timer 0 / timer 1 is used independently, set any mode except cascade connection.

The initial value of the TM3CK2-0 in the TM3MD register is indefinite. When timer 2 / timer 3 is used independently, set any mode except cascade connection.

If fx is selected as the count clock source in timer 1, timer 2, when the binary counter is read at operation, uncertain value on counting up may be read. To prevent this, select the synchronous fx as the count clock source. In this case, the timer 1, 2 counter counts up in synchronization with system clock, therefore the correct value is always read. But, if the synchronous fx is selected as the count clock source, CPU mode cannot return from STOP/HALT mode.

# 5-4 8-Bit Event Count

### 5-4-1 Operation

Event count operation has 2 types ; TMnIO input and synchronous TMnIO input can be selected as the count clock.

#### ■8-Bit Event Count Operation

Event count means that the binary counter (TMnBC) counts the input signal from external to the TMnIO pin. If the value of the binary counter reaches the setting value of the compare register (TMnOC), interrupts can be generated at the next count clock.

	Timer 0	Timer 1	Timer 2	Timer 3
Event input	TM0IO input	TM1IO input	TM2IO input	TM3IO input
	(P10)	(P11)	(P12)	(P13)
	Synchronous	Synchronous	Synchronous	Synchronous
	TM0IO input	TM1IO input	TM2IO input	TM3IO input

 Table 5-4-1
 Event Count Input Clock

#### ■Count Timing of TMnIO Input (Timers 0, 1, 2 and 3)

When TMnIO input is selected, TMnIO input signal is directly input to the count clock of the timer n. The binary counter counts up at the falling edge of the TMnIO input signal.

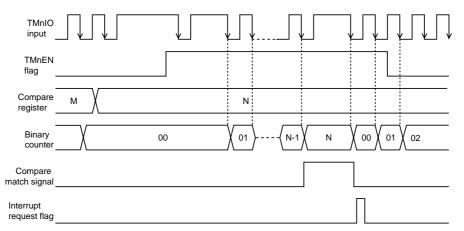

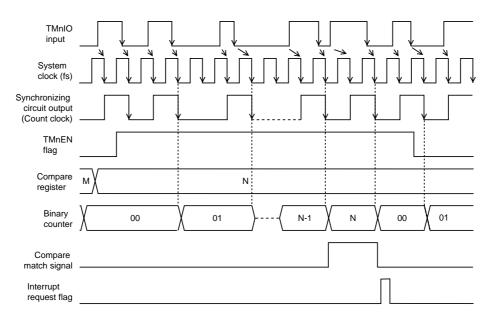

Figure 5-4-1 Count Timing of TMnIO Input (Timers 0 to 3)

When the TMnIO input is selected for count clock source and the value of the timer n binary counter is read during operation, incorrect value at count up may be read. To prevent this, use the event count by synchronous TMnIO input, as the following page.

0

#### Count Timing of Synchronous TMnIO Input (Timers 0, 1, 2 and 3)

If the synchronous TMnIO input is selected, the synchronizing circuit output signal is input to the timer n count clock. The synchronizing circuit output signal is changed at the falling edge of the system clock after the TMnIO input signal is changed.

#### Figure 5-4-2 Count Timing of Synchronous TMnIO Input (Timers 0 to 3)

When the synchronous TMnIO input is selected as the count clock source, the timer n counter counts up in synchronization with system clock, therefore the correct value is always read.

But, if the synchronous TMnIO is selected as the count clock source, CPU mode cannot return from STOP/HALT mode.

### 5-4-2 Setup Example

#### ■Event Count Setup Example (Timers 0, 1, 2 and 3)

If the falling edge of the TM0IO input pin signal is detected 5 times with using timer 0, an interrupt is generated.

An example setup procedure, with a description of each step is shown below.

	Setup Procedure		Description
(1) \$	Stop the counter. TM0MD (x'3F80') bp4 :TM0EN = 0	(1)	Set the TM0EN flag of the timer 0 mode register (TM0MD) to "0" to stop timer 0 counting.
(2) \$	Set the special function pin to input. P1DIR (x'3F31') bp0 :P1DIR0 = 0	(2)	Set the P1DIR0 flag of the port 1 direction control register (P1DIR) to "0" to set P10 pin to input mode. If it needs, pull up resistor should be added.
			[ C Chapter 4. I/O Port Function ]
(3) 5	Select the normal timer operation. TM0MD (x'3F80') bp3 :TM0PWM = 0	(3)	Set the TM0PWM flag of the TM0MD register to "0" to select the normal timer operation.
(4) 5	Select the count clock source. TM0MD (x'3F80') bp2-0 :TM0CK2-0 = 011	(4)	Select the clock source to TM0IO input by the TM0CK2-0 flag of the TM0MD register.
(5) \$	Set the interrupt generation cycle. TM0OC (x'3F70') = x'04'	(5)	Set the timer 0 compare register (TM0OC) the interrupt generation cycle. Counting is 5, so the setting value should be 4. At that time, the timer 0 binary counter (TM0BC) is initialized to x'00'.
(6) \$	Set the interrupt level. TM0ICR (x'3FE4') bp7-6 :TM0LV1-0 = 10	(6)	Set the interrupt level by the TM0LV1-0 flag of the timer 0 interrupt control register (TM0ICR). If any interrupt request flag had already been set, clear it. [ C>P Chapter 3 3-1-4. Interrupt Flag Setup ]

Setup Procedure	Description	
(7) Enable the interrupt. TM0ICR (x'3FE4') bp1 :TM0IE = 1	<ul><li>(7) Set the TM0IE flag of the TM0ICR register to "1" to enable the interrupt.</li></ul>	
<ul> <li>(8) Start the event counting.</li> <li>TM0MD (x'3F80')</li> <li>bp4 :TM0EN = 1</li> </ul>	(8) Set the TM0EN flag of the TM0MD register to start timer 0.	

Every time TM0BC detects the falling edge of TM0IO input, TM0BC counts up from 'x00'. When TM0BC reaches the setting value of theTM0OC register, the timer 0 interrupt request flag is set at the next count clock, then the value of TM0BC becomes x'00' and counting up is restarted.

# 5-5 8-Bit Timer Pulse Output

### 5-5-1 Operation

The TMnIO pin can output a pulse signal with any cycle.

■Operation of Timer Pulse Output (Timers 0, 1, 2 and 3)

The timers can output 2 x cycle signal, compared to the setting value in the compare register (TMnOC). Output pins are as follows ;

Table 5-5-1 Timer Pulse Output Pins

	Timer 0	Timer 1	Timer 2	Timer 3
Pulse output pin	TM0IO output	TM1IO output	TM2IO output	TM3IO output
	(P10)	(P11)	(P12)	(P13)

■Count Timing of Timer Pulse Output (Timers 0, 1, 2 and 3)

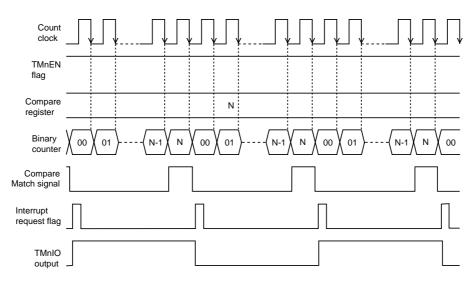

Figure 5-5-1 Count Timing of Timer Pulse Output (Timers 0 to 3)

The TMnIO pin outputs 2 x cycle, compared to the value in the compare register. If the binary counter reaches the compare register, and the binary counter is cleared to x'00', TMnIO output is inverted.

### 5-5-2 Setup Example

■Timer Pulse Output Setup Example (Timers 0, 1, 2 and 3)

TM0IO pin outputs 50 kHz pulse by using timer 0. For this, select fosc as clock source, and set a 1/2 cycle (100 kHz) for the timer 0 compare register (at fosc=20 MHz).

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description	
<ul><li>(1) Stop the counter.</li><li>TM0MD (x'3F80')</li><li>bp4 :TM0EN = 0</li></ul>	(1) Set the TM0EN flag of the timer 0 mode register (TM0MD) to "0" to stop timer 0 counting.	
<ul> <li>(2) Set the special function pin to the output mode.</li> <li>P1OMD (x'3F39')</li> <li>bp0 :P1OTC0 = 1</li> <li>P1DIR (x'3F31')</li> <li>bp0 :P1DIR0 = 1</li> </ul>	<ul> <li>(2) Set the P1OTC0 flag of the port 1 output mode register (P1OMD) to "1" to set P10 the special function pin.</li> <li>Set the P1DIR0 flag of the port 1 direction control register (P1DIR) to "1" to set output mode.</li> <li>If it needs, pull-up resister should be added.</li> <li>[ C Chapter 4. I/O Ports ]</li> </ul>	
<ul><li>(3) Select the normal timer operation. TM0MD (x'3F80')</li><li>bp3 :TM0PWM = 0</li></ul>	(3) Set the TM0PWM flag of the TM0MD register to "0" to select the normal timer operation.	
<ul><li>(4) Select the count clock source.</li><li>TM0MD (x'3F80')</li><li>bp2-0 :TM0CK2-0 = 000</li></ul>	(4) Select fosc for the clock source by the TM0CK2-0 flag of the TM0MD register.	
<ul><li>(5) Set the timer pulse output cycle.</li><li>TM0OC (x'3F70') = x'C7'</li></ul>	<ul> <li>(5) Set the timer 0 compare register (TM0OC) to the 1/2 of the timer pulse output cycle. The setting value should be 200-1=199(x'C7'), because 100 kHz is divided by 20 MHz. At that time, the timer 0 binary counter (TM0BC) is initialized to x'00'.</li> </ul>	
<ul> <li>(6) Start the timer operation.</li> <li>TM0MD (x'3F80')</li> <li>bp4 :TM0EN = 1</li> </ul>	(6) Set the TM0EN flag of the TM0MD register to "1" to start timer 0.	

TM0BC counts up from x'00'. If TM0BC reaches the setting value of the TM0OC register, then TM0BC is cleared to x'00', TM0IO output signal is inverted and TM0BC restarts to count up from x'00'.

When port 1 is used as pulse output pin, the settings of the port 1 direction control register (P1DIR) and the port 1 pull-up register (P1PLU) are need to set to "1".

Set the compare register value as follows,

The compare register value =  $\frac{\text{The timer pulse output cycle}}{\text{The count clock cycle X 2}} - 1$ 

,

#### The initial value of timer output and the initialization (low level)

	Initial value (after reset release)	To initialize (Set to low level)	Program example
Timer 0	Low level	After timers 0 and 1 are set to cascade connection, the setting should be the original.	mov x'04', (TM1MD) bclr (TM1MD), 2
Timer 1	indefinite	After P11 output selection is set to the timer 0 PWM output (TM1PWM flag = 1), the setting should be back to the timer 1 output.	mov x'08', (TM1MD) bclr (TM1MD), 3
Timer 2	Low level	After timers 2 and 3 are set to cascade connection, the setting should be the original.	mov x'04', (TM3MD) bclr (TM3MD), 2
Timer 3	indefinite	After P13 output selection is set to the timer 2 PWM output (TM2PWM flag = 1), the setting should be back to the timer 3 output.	mov x'08', (TM3MD) bclr (TM3MD), 3

# 5-6 8-Bit PWM Output

The TMnIO pin outputs the PWM waveform, which is determined by the match timing for the compare register and the overflow timing of the binary counter.

### 5-6-1 Operation

■Operation of 8-Bit PWM Output (Timers 0 and 2)

The PWM waveform with any duty cycle is generated by setting the duty cycle of PWM "H" period to the compare register (TMnOC). The cycle is the period from the full count to the overflow of the 8-bit timer. Table 5-6-1 shows PWM output pins ;

	Timer 0	Timer 2
PWM output pin	TM0lO output pin (P10)	TM2IO output pin (P12)
r www.output.pm	TM1IO output pin (P11)	TM3IO output pin (P13)

#### Count Timing of PWM Output (at normal) (Timers 0 and 2)

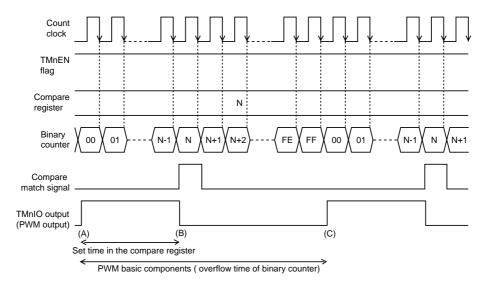

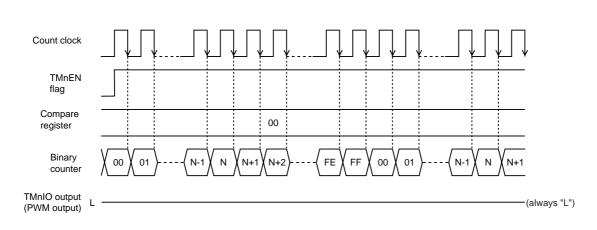

Figure 5-6-1 Count Timing of PWM Output (at Normal)

PWM source waveform,

- (A) is "H" while counting up from x'00' to the value stored in the compare register.
- (B) is "L" after the match to the value in the compare register, then the binary counter continues counting up till the overflow.
- (C) is "H" again, if the binary counter overflows.

■Count Timing of PWM Output (when the compare register is x'00') (Timers 0 and 2) Here is the count timing when the compare register is set to x'00';

■Count Timing of PWM Output (when the compare register is x'FF') (Timers 0, 2) Here is the count timing when the compare register is set to x'FF';

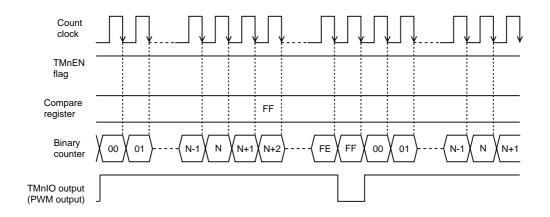

Figure 5-6-3 Count Timing of PWM Output (when compare register is x'FF')

### 5-6-2 Setup Example

#### ■PWM Output Setup Example (Timers 0 and 2)

The 1/4 duty cycle PWM output waveform is output from the TM0IO output pin at 2 kHz by using timer 0 (at fosc=4.19 MHz). Cycle period of PWM output waveform is decided by the overflow of the binary counter. "H" period of the PWM output waveform is decided by the setting value of the compare register. An example setup procedure, with a description of each step is shown below.

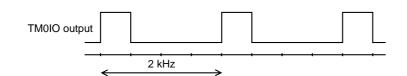

Figure 5-6-4 Output Waveform of TM0IO Output Pin

Setup Procedure	Description
<ul><li>(1) Stop the counter.</li><li>TM0MD (x'3F80')</li><li>bp4 :TM0EN = 0</li></ul>	(1) Set the TM0EN flag of the timer 0 mode register (TM0MD) to "0" to stop the timer 0 counting.
<ul> <li>(2) Set the special function pin to the output mode.</li> <li>P1OMD (x'3F39')</li> <li>bp0 :P1OTC0 = 1</li> <li>P1DIR (x'3F31')</li> <li>bp0 :P1DIR0 = 1</li> </ul>	<ul> <li>(2) Set the P1OTC0 flag of the port 1 output mode register (P1OMD) to "1" to set P10 pin to the special function pin.</li> <li>Set the P1DIR0 flag of the port 1 direction control register (P1DIR) to "1" for the output mode.</li> <li>If it needs, pull up resistor should be added.</li> <li>[CP Chapter 4. I/O Ports ]</li> </ul>
<ul> <li>(3) Select the PWM operation.</li> <li>TM0MD (x'3F80')</li> <li>bp3 :TM0PWM = 1</li> </ul>	(3) Set the TM0PWM flag of the TM0MD register to "1" to select the PWM operation.
<ul><li>(4) Select the count clock source. TM0MD (x'3F80') bp2-0 :TM0CK2-0 = 010</li></ul>	(4) Select "fs/4" for the clock source by the TM0CK2-0 flag of the TM0MD register.

Setup Procedure	Description	
(5) Set the period of PWM "H" output. TM0OC (x'3F70') = x'40'	<ul> <li>(5) Set the "H" period of PWM output to the timer 0 compare register (TM0OC).</li> <li>The setting value is set to 256 / 4 = 64 (x'40'), because it should be the 1/4 duty of the full count (256).</li> <li>At that time, the timer 0 binary counter (TM0BC) is initialized to x'00'.</li> </ul>	
<ul> <li>(6) Start the timer operation.</li> <li>TM0MD (x'3F80')</li> <li>bp4 :TM0EN = 1</li> </ul>	<ul><li>(6) Set the TM0EN flag of the TM0MD register to "1" to operate timer 0.</li></ul>	

TM0BC counts up from x'00'. PWM source waveform outputs "H" till TM0BC reaches the setting value of the TM0OC register, and outputs "L" after that. Then, TM0BC continues counting up, and PWM source waveform outputs "H" again, once overflow happens, and TM0BC restarts counting up from x'00'.

If the timer 0 PWM output is selected by setting the TM1PWM flag of the TM1MD register to "1", the TM1IO pin outputs the timer 0 PWM output, too.

If the timer 2 PWM output is selected by setting the TM3PWM flag of the TM3MD register to "1", the TM3IO pin outputs the timer 2 PWM output, too.

When port 1 is used as PWM output pin, the settings of the P1DIR register and the P1PLU register are need to set to "1".

# 5-7 8-Bit Timer Synchronous Output

### 5-7-1 Operation

When the binary counter of the timer reaches the set value of the compare register, the latched data is output from port 7 at the next count clock.

Synchronous Output Operation by 8-Bit timer (Timer 1, Timer 2)

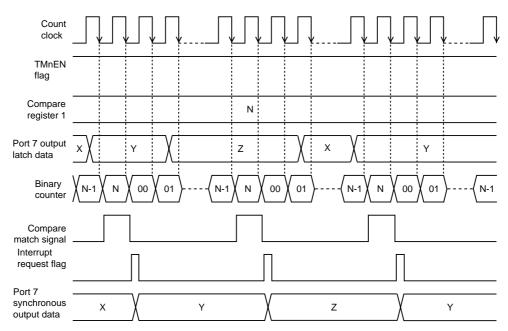

The port 7 latched data is output from the output pin at the interrupt request generation by the match of the binary counter and the compare register.

Only port 7 can perform synchronous output operation, and individual pins can be set. 8-Bit timers that have synchronous output operation are timer 1 and timer 2.

Table 5-7-1	Synchronous	<b>Output Port</b>	(Timer 1,	Timer 2)

	Timer 1	Timer 2
Synchronous		
output port	Port 7	Port 7

#### Count Timing of Synchronous Output (Timer 1, Timer 2)

#### Figure 5-7-1 Count Timing of Synchronous Output (Timer 1, Timer 2)

The port 7 latched data is output from the output pin in synchronization with the interrupt request generation by the match of binary counter and compare register.

## 5-7-2 Setup Example

#### ■Synchronous Output Setup Example (Timer 1, Timer 2)

Setup example that latched data of port 7 is output constantly (100  $\mu$ s) by using timer 2 from the synchronous output pin is shown below. The clock source of timer 2 is selected fs/4 (at fosc=8 MHz). An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul><li>(1) Start the counter.</li><li>TM2MD (x'3F82')</li><li>bp4 :TM2EN = 0</li></ul>	<ol> <li>Set the TM2EN flag of the timer 2 mode register (TM2MD) to "0" to stop the timer 2 counting.</li> </ol>
<ul> <li>(2) Select the synchronous output event.</li> <li>FLOAT2 (x'3F4C')</li> <li>bp1-0 :P7SYEVS2-1 = 10</li> </ul>	(2) Set the P7SYEVS2-1 flag of the pin control register 2 (FLOAT2) to "10" to set the synchronous output event to timer 2 interrupt.
<ul> <li>(3) Set the synchronous output pin. SYSMD (x'3F1F') = x'FF' P7DIR (x'3F37') = x'FF'</li> </ul>	<ul> <li>(3) Set the synchronous output control register (SYSMD) to x'FF' to set the synchronous output pin.</li> <li>(P77 to P70 are synchronous output pin.) Set the port 7 direction control register</li> <li>(P7DIR) to x'FF' to set port 7 to output mode. If it needs, pull up resistor should be added.</li> <li>[ CP Chapter 4. I/O Ports ]</li> </ul>
<ul><li>(4) Select the normal timer operation. TM2MD (x'3F82')</li><li>bp3 :TM2PWM = 0</li></ul>	<ul><li>(4) Set the TM2PWM flag of the TM2MD register to "0" to select the normal timer operation.</li></ul>
<ul><li>(5) Select the count clock source. TM2MD (x'3F82') bp2-0 :TM2CK2-0 = 001</li></ul>	(5) Select fs/4 for clock source by TM2CK2-0 flag of the TM2MD register.

Setup Procedure	Description
<ul> <li>(6) Set the synchronous output event generation cycle.</li> <li>TM2OC (x'3F72') = x'63'</li> </ul>	<ul> <li>(6) Set the synchronous output generation cycle to the timer 2 compare register (TM2OC). The setting value is set to 100-1=99(x'63'), because 1 MHz is divided by 10 kHz. At that time, the timer 2 binary counter (TM2BC) is initialized to x'00'.</li> </ul>
<ul> <li>(7) Start the timer operation.</li> <li>TM2MD (x'3F82')</li> <li>bp4 :TM2EN = 1</li> </ul>	<ul><li>(7) Set the TM2EN flag of the TM2MD register to "1" to start timer 2.</li></ul>

TM2BC counts up from x'00'. If any data is written to the port 7 output register (P7OUT), the data of port 7 is output from the synchronous output pin in every time an interrupt request is generated by the match of TM2BC and the set value of the TM2OC register.

When the port 7 synchronous output is disabled, the value of the synchronous output value storage register is not always same to the value of the port 7 output register (P7OUT). Therefore, the pin output may be changed at the switching from the general output to the synchronous output.

# 5-8 Serial Interface Transfer Clock Output

### 5-8-1 Operation

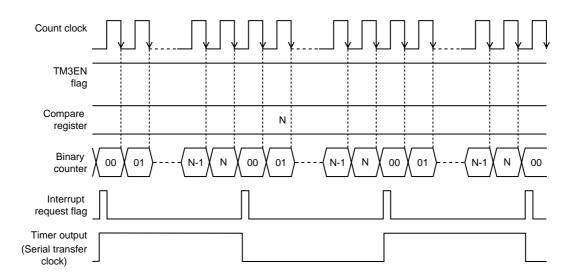

Serial interface transfer clock can be created by using the timer output signal.

Serial Interface Transfer Clock Operation by 8-Bit Timer (Timer 0 and Timer 3)
 Timer 0 output can be used as a transfer clock source for serial interface 2.
 Timer 3 output can be used as a transfer clock source for serial interface 0 and serial interface 1.

 Table 5-8-1
 Timer for Serial Interface Transfer Clock

Serial transfer clock	Timer 0	Timer 3
Serial interface 0	-	
Serial interface 1	-	
Serial interface 2		-

■Timing of Serial Interface Transfer Clock (Timer 0 and Timer 3)

#### Figure 5-8-1 Timing of Serial Interface Transfer Clock (Timer 0 and Timer 3)

The timer pulse output is used as the clock source of the serial interface. And its frequency is 1/2 of the set frequency in the timer compare register.

The count timing is same to the timing of timer operation. For the baud rate calculation and the serial interface setup, refer to chapter 10. Serial Interface 0.

### 5-8-2 Setup Example

Serial Interface Transfer Clock Setup Example (Timer 0 and Timer 3)

How to create a transfer clock for half duplex UART (serial interface 0) using with timer 3 is shown below. The baud rate is selected to be 300 bps, the source clock of timer 3 is selected to be fs/4 (at fosc=8 MHz).

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul><li>(1) Stop the counter.</li><li>TM3MD (x'3F83')</li><li>bp4 :TM3EN = 0</li></ul>	<ul><li>(1) Set the TM3EN flag of the timer 3 mode register (TM3MD) to "0" to stop timer 3 counting.</li></ul>
<ul> <li>(2) Select the normal timer operation. TM3MD (x'3F83')</li> <li>bp3 :TM3PWM = 0</li> </ul>	(2) Set the TM3PWM flag of the TM3MD register to "0" to select the normal timer operation.
<ul> <li>(3) Select the count clock source. TM3MD (x'3F83') bp2-0 :TM3CK2-0 = 001</li> </ul>	(3) Select the clock source to fs/4 by the TM3CK2-0 flag of the TM3MD register.
(4) Set the baud rate. TM3OC (x'3F73') = x'CF'	<ul> <li>(4) Set the timer 3 compare register (TM3OC) to the value that baud rate comes to 300 bps.</li> <li>[ C→ Chapter 10. Table 10-3-18 ] At that time, the timer 3 binary counter (TM3BC) is initialized to x'00'.</li> </ul>
(5) Start the timer operation TM3MD (x'3F83') bp4 :TM3EN = 1	<ul><li>(5) Set the TM3EN flag of the TM3MD register to "1" to start timer 3.</li></ul>

TM3BC counts up from x'00'. Timer 3 output is the clock of the serial interface 0 at transmission and reception.

For the compare register setup value and the serial interface operation setup, refer to chapter 10. Serial Interface 0.

# 5-9 Cascade Connection

### 5-9-1 Operation

Cascading timers 0 and 1, or timer 2 and 3 form a 16-bit timer.

■8-Bit Timer Cascade Connection Operation (Timer 0 + Timer 1, Timer 2 + Timer 3) Timer 0 and timer 1, or timer 2 and timer 3 are combined to be a 16-bit timer. Cascading timer is operated at clock source of timer 0 or timer 2 which are lower 8 bits.

	Timer 0 + Timer 1 (16 Bit)	Timer 2 + Timer 3 (16 Bit)		
Interrupt source	TM1IRQ	TM3IRQ		
Timer operation	$\checkmark$	$\checkmark$		
Event count	$\sqrt[]{}$ (TM0IO input)	(TM2IO input)		
Timer pulse output	(TM1IO output)	(TM3IO output)		
PWM output	-	-		
Synchronous output	$\checkmark$	-		
Serial interface transfer clock output	-	(TM3IO output)		
Remote control carrier		V		
Clock source for the formula f				
fosc : Machine clock (High speed oscillation ) fx : Machine clock (Low speed oscillation ) fs : System clock (at NORMAL mode : fs=fosc/2, at SLOW mode : fs=fx/4)				

#### Table 5-9-1 Timer Functions at Cascade Connection

At cascade connection, the binary counter and the compare register are operated as a 16 bit register. At operation, set the TMnEN flag of the upper and lower 8-bit timers to "1" to be operated. Also, the clock source is the one which is selected in the lower 8-bit timer.

Other setup and count timing is the same to the 8-bit timer at independently operation.

When timer 0 and timer 1 are used in cascade connection, timer 1 interrupt request flag is used. Disable the timer 0 interrupt. Timer pulse output of timer 0 is "L" fixed output.

When timer 2 and timer 3 are used in cascade connection, timer 3 interrupt request flag is used. Disable the timer 2 interrupt. Timer pulse output of timer 2 is "L" fixed output.

At the cascade connection, if the binary counter should be cleared by rewriting the compare register, the TMnEN flags of the lower and upper 8 bits timers mode registers should be set to "0" to stop the counting, then rewrite the compare register.

Also, set the (TM1OC + TM0OC) register and the (TM3OC + TM2OC) register by the 16-bit access instruction.

### 5-9-2 Setup Example

■Cascade Connection Timer Setup Example (Timer 0 + Timer 1, Timer 2 + Timer 3) Setting example of timer function that an interrupt is constantly generated by cascade connection of timer 0 and timer 1, as a 16-bit timer is shown. An interrupt is generated in every 2500 cycles (1 ms) by selecting source clock to fs/4 (fosc=20 MHz).

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul> <li>(1) Stop the counter. TM0MD (x'3F80') bp4 :TM0EN = 0 TM1MD (x'3F81') bp4 :TM1EN = 0     </li> </ul>	<ol> <li>Set the TM0EN flag of the timer 0 mode register (TM0MD) to "0", the TM1EN flag of the timer 1 mode register (TM1MD) to "0" to stop timer 0 and timer 1 counting.</li> </ol>
<ul> <li>(2) Select the normal operation of lower timer</li> <li>TM0MD (x'3F80')</li> <li>bp3 :TM0PWM = 0</li> </ul>	(2) Set both of the TM0PWM flag of the TM0MD register to "0" to select the normal operation of timer 0.
<ul> <li>(3) Set the cascade connection.</li> <li>TM1MD (x'3F81')</li> <li>bp2-0 :TM1CK2-0 = 100</li> </ul>	(3) Connect timer 1 and timer 0 in cascade connection by the TM1CK2-0 flag of the TM1MD register.
<ul><li>(4) Select the count clock source. TM0MD (x'3F80') bp2-0 :TM0CK2-0 = 010</li></ul>	(4) Set the clock source to fs/4 by the TM0CK2-0 flag of the TM0MD register.
(5) Set the interrupt generation cycle TMnOC(x'3F71', x'3F70')=x'09C3'	<ul> <li>(5) Set the timer 1 compare register + timer 0 compare register (TM1OC + TM0OC) to the interrupt generation cycle (x'09C3' : 2500 cycles - 1).</li> <li>At that time, timer 1 binary counter + timer 0 binary counter (TM1BC + TM0BC) are initialized to x'0000'.</li> </ul>
<ul> <li>(6) Disable the lower timer interrupt.</li> <li>TM0ICR (x'3FE4')</li> <li>bp1 :TM0IE = 0</li> </ul>	(6) Set the TM0IE flag of the timer 0 interrupt control register (TM0ICR) to "0" to disable the interrupt.

Setup Procedure	Description
<ul> <li>(7) Set the level of the upper timer interrupt.</li> <li>TM1ICR (x'3FE5')</li> <li>bp7-6 :TM1LV1-0 = 10</li> </ul>	<ul> <li>(7) Set the interrupt level by the TM1LV1-0 flag of the timer 1 interrupt control register (TM1ICR).</li> <li>If any interrupt request flag had already been set, clear it.</li> </ul>
<ul> <li>(8) Enable the upper timer interrupt.</li> <li>TM1ICR (x'3FE5')</li> <li>bp1 :TM1IE = 1</li> </ul>	<ul> <li>(8) Set the TM1IE flag of the TM1ICR register to</li> <li>"1" to enable the interrupt.</li> <li>[ CP Chapter 3 3-1-4. Interrupt Flag Setup ]</li> </ul>
<ul><li>(9) Start the upper timer operation.</li><li>TM1MD (x'3F81')</li><li>bp4 :TM1EN = 1</li></ul>	<ul><li>(9) Set the TM1EN flag of the TM1MD register to "1" to start timer 1.</li></ul>
(10) Start the lower timer operation. TM0MD (x'3F80') bp4 :TM0EN = 1	(10) Set the TM0EN flag of the TM0MD register to "1" to start timer 0.

TM1BC + TM0BC counts up from x'0000' as a 16-bit timer. When TM1BC + TM0BC reaches the set value of TM1OC + TM0OC register, the timer 1 interrupt request flag is set to "1" at the next count clock, and the value of TM1BC + TM0BC becomes x'0000' and counting up is restarted.

Use a 16-bit access instruction to set the (TM1OC + TM0OC) register and the (TM3OC + TM2OC) register.

If the lower timer starts to operate before the upper timer does, the first overflow signal of the lower timer may be invalid. To prevent this, start the upper timer operation before the lower timer operation.

# 5-10 Remote Control Carrier Output

### 5-10-1 Operation

Carrier pulse for remote control can be generated.

■Operation of Remote Control Carrier Output (Timer 0, Timer 3)

Remote control carrier pulse is based on output signal of timer 0 or timer 3. Duty cycle is selected from 1/2, 1/3. RMOUT (P10) outputs remote control carrier output signal.

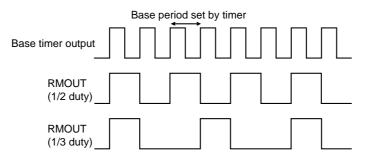

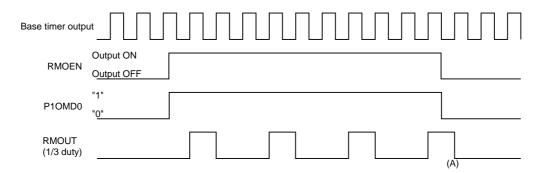

Figure 5-10-1 Duty Cycle of Remote Control Carrier Output Signal

Count Timing of Remote Control Carrier Output (Timer 0, Timer 3)

#### Figure 5-10-2 Count Timing of Remote Control Carrier Output Function (Timer 0, Timer 3)

(A) Even if the RMOEN flag is off when the carrier output is high, the carrier waveform is held by the synchronizing circuit.

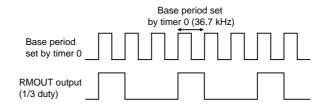

When the RMOEN flag is changed, do not change the base cycle and its duty at the same time. If they are changed at the same time, the carrier wave form is not output properly.

### 5-10-2 Setup Example

■Remote Control Carrier Output Setup Example (Timer 0, Timer 3)

Here is the setting example that the RMOUT pin outputs the 1/3 duty carrier pulse signal with "H" period of 36.7 kHz, by using timer 0. The source clock of timer 0 is set to fosc (at 8 MHz).

An example setup procedure, with a description of each step is shown below.

	Setup Procedure		Description
(1)	Disable the remote control carrier output. RMCTR (x'3F89') bp3 : RMOEN = 0	(1)	Set the RMOEN flag of the remote control carrier output control register (RMCTR) to "0" to disable the remote control carrier output.
(2)	Select the base cycle setting timer. RMCTR (x'3F89') bp0 : RMBTMS = 1	(2)	Set the RMBTMS flag of the RMCTR register to "1" to set the timer as a base cycle setting timer.
(3)	Select the carrier output duty. RMCTR (x'3F89') bp1 : RMDTY0 = 1	(3)	Set the RMDTY0 flag of the RMCTR register to "1" to select 1/3 duty.
(4)	Stop the counter. TM0MD (x'3F80') bp4 : TM0EN = 0	(4)	Set the TM0EN flag of the timer 0 mode register (TM0MD) to "0" to stop the timer 0 counting.
(5)	Set the remote control carrier output of the special function pin. P1OUT (x'3F11') bp0 : P1OUT0 = 0 P1OMD (x'3F39') bp0 : P1OTC0 = 1 P1DIR (x'3F31') bp0 : P1DIR0 = 1 RMCTR (x'3F89')	(5)	Set the P1OUT0 flag of the port 1 output register (P1OUT) to "0" to set the output data of P10 pin to "0. Set the P1OTC0 flag of the port 1 output mode register (P1OMD) to "1" to set P10 pin as a special function pin. Set the P1DIR0 flag of the port 1 direction control register (P1DIR) to "1" for output mode. Set the TM0RM flag of the RMCTR register to
	bp4 :TM0RM = 0		"0" to select the remote control carrier output.

Setup Procedure	Description
<ul> <li>(6) Select the normal timer operation.</li> <li>TM0MD (x'3F80')</li> <li>bp3 : TM0PWM = 0</li> </ul>	(6) Set the TM0PWM flag of the TM0MD register to "0" to select normal timer operation.
<ul><li>(7) Select the count clock source.</li><li>TM0MD (x'3F80')</li><li>bp2-0 : TM0CK2-0 = 000</li></ul>	(7) Select fosc to clock source by the TM0CK2-0 flag of the TM0MD register.
<ul> <li>(8) Set the base cycle of remote control carrier.</li> <li>TM0OC (x'3F70') = x'6C'</li> </ul>	<ul> <li>(8) Set the base cycle of remote control carrier by writing x'6C' to the timer 0 compare register (TM0OC). The set value should be (8 MHz/73.4 kHz) - 1 = 108(x'6C')</li> <li>8 MHz is divided to be 73.4 kHz, 2 times 36.7 kHz.</li> </ul>
<ul> <li>(9) Start the timer operation.</li> <li>TM0MD (x'3F80')</li> <li>bp4 : TM0EN = 1</li> </ul>	<ul><li>(9) Set the TM0EN flag of the TM0MD register to "1" to stop the timer 0 counting.</li></ul>
<ul> <li>(10) Enable the remote control carrier output.</li> <li>RMCTR (x'3F89')</li> <li>bp3 : RMOEN = 1</li> </ul>	<ul><li>(10) Set the RMOEN flag of the RMCTR register to</li><li>"1" to enable the remote control carrier output.</li></ul>

TM0BC counts up from x'00'. Timer 0 outputs the base cycle pulse set in TM0OC. Then, the 1/3 duty remote control carrier pulse signal is output. If the RMOEN flag of the RMCTR register is set to "0", the remote control carrier pulse signal output is stopped.

# Chapter 6 16-Bit Timer

6

# 6-1 Overview

This LSI contains a general-purpose 16-bit timer (Timer 4).

### 6-1-1 Functions

Table 6-1-1 shows the functions of timer 4 can use.

	Timer 4 (16-bit timer)
Interrupt source	TM4IRQ
Timer operation	$\checkmark$
Event count	
Timer pulse output	$\checkmark$
PWM output (Added Pulse Type)	
Synchronous output	
Capture function	√
Clock source	fosc fs/4 fs/16 TM4IO input
fosc : Machine clock (High speed oscillation ) fs : System clock ( at NORMAL mode : fs=fosc/2, a	at SLOW mode : fs=fx/4)

### 6-1-2 Block Diagram

■Timer 4 Block Diagram

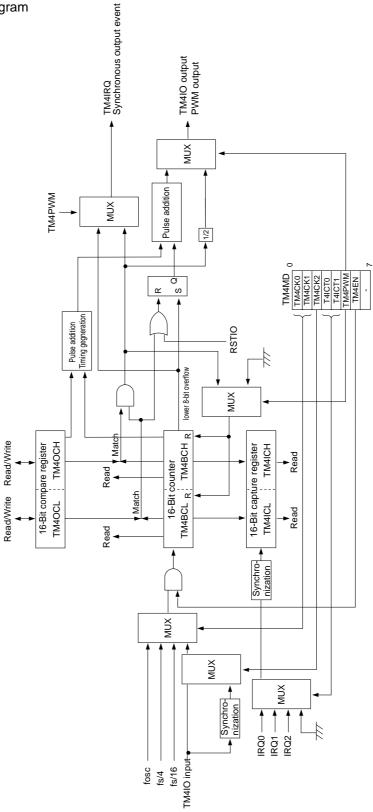

Figure 6-1-1 Timer 4 Block Diagram

# 6-2 Control Registers

Timer 4 contains the binary counter (TM4BCL/TM4BCH), the compare register (TM4OCL/TM4OCH) and input capture register (TM4ICL/TM4ICH). The timer 4 mode register (TM4MD) controls timer 4.

### 6-2-1 Registers

Table 6-2-1 shows the registers that control timer 4.

	Register	Address	R/W	Function	Page
Timer 4	TM4BCL	x'03F64'	R	Timer 4 binary counter (lower 8 bits)	VI - 5
	TM4BCH	x'03F65'	R	Timer 4 binary counter (upper 8 bits)	VI - 5
	TM4OCL	x'03F74'	R/W	Timer 4 compare register (lower 8 bits)	VI - 5
	TM4OCH	x'03F75'	R/W	Timer 4 compare register (upper 8 bits)	VI - 5
	TM4ICL	x'03F66'	R	Timer 4 input capture regsiter (lower 8 bits)	VI - 6
	TM4ICH	x'03F67'	R	Timer 4 input capture register (upper 8 bits)	VI - 6
	TM4MD	x'03F84'	R/W	Timer 4 mode register	VI - 7
	TM4ICR	x'03FEF'	R/W	Timer 4 interrupt register (timer 4 compare match)	III - 26
	P10MD	x'03F39'	R/W	Port 1 output mode register	IV - 14
	P1DIR	x'03F31'	R/W	Port 1 direction control register	IV - 13

#### Table 6-2-1 16-Bit Timer Control Registers

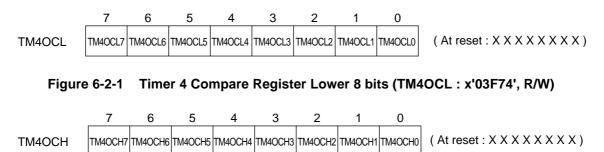

R/W : Readable/Writable R : Readable only

### 6-2-2 Programmable Timer Registers

Timer 4 has a 16-bit programmable timer register. It contains a compare register, a binary counter and a capture register. Each register has 2 sets of 8-bit register. Operate by 16-bit access.

Compare register is a 16-bit register stores the value that compared to binary counter.

■Timer 4 Compare Register (TM4OC)

Binary counter is a 16-bit up counter. If any data is written to a compare register during counting is stopped, the binary counter is cleared to x'0000'.

■Timer 4 Binary Counter (TM4BC)

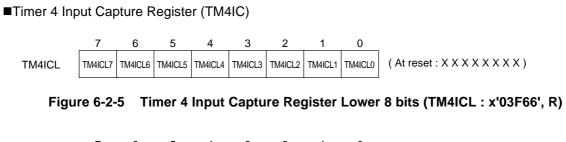

Figure 6-2-4 Timer 4 Binary Counter Upper 8 bits (TM4BCH : x'03F65', R)

Input capture register is a register that holds the value loaded from a binary counter by capture trigger. Capture trigger is generated by an input signal from an external interrupt pin (Directly writing to the register by program is disable.).

Figure 6-2-6 Timer 4 Input Capture Register Upper 8 bits (TM4ICH : x'03F67', R)

### 6-2-3 Timer Mode Registers

This is a readable / writable register that controls timer 4.

#### ■Timer 4 Mode Register (TM4MD)

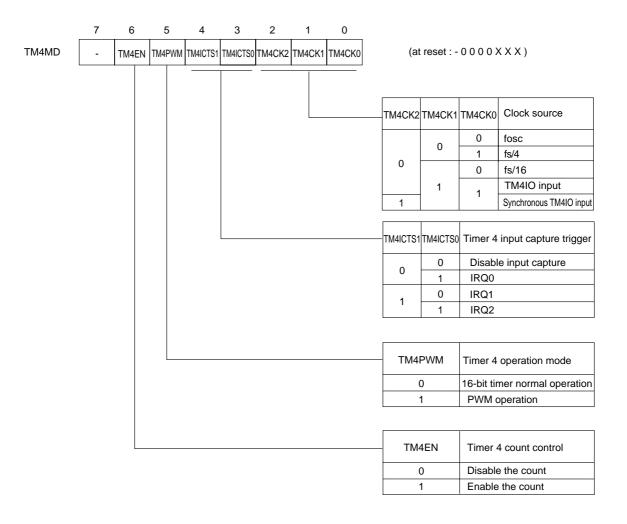

Figure 6-2-7 Timer 4 Mode Register (TM4MD : x'03F84', R/W)

# 6-3 16-Bit Timer Count

### 6-3-1 Operation

Timer operation can constantly generate interrupt.

#### ■16-Bit Timer Operation (Timer 4)

The generation cycle of an timer interrupt is set by the clock source selection and the set value of the compare register (TM4OC), in advance. When the binary counter (TM4BC) reaches the set value of the compare register, the timer 4 interrupt request flag is set to "1" at the next count clock, the binary counter (TM4BC) is cleared to x'0000' and the counting up is restarted from x'0000'.

When the CPU reads the 16-bit binary counter (TM4BC), the read data is treated as 8-bits unit data, even if it is a 16-bit MOVW instruction. As a result, the CPU will read the data incorrectly if a carry from the lower 8 bits to the upper 8 bits occurs during counting.

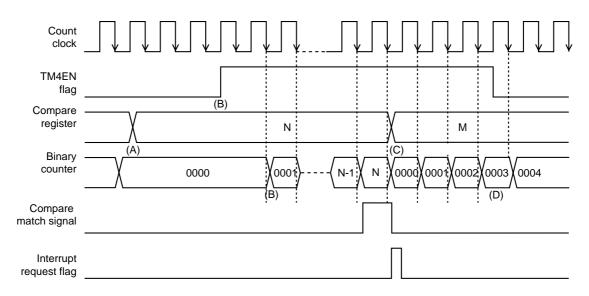

Table 6-3-1 shows the clock source that can be selected.

Clock source	1 count time	
fosc	50 ns	
fs/4	400 ns	
fs/16	1.6 µs	
as fosc = 20 MHz, fs = fosc/2 = 10 MHz		

#### Table 6-3-1 Clock Source at Timer Operation (Timer 4)

Count Timing of Timer Operation (Timer 4)

The binary counter counts up with the selected clock source as the count clock. The basic operation of the whole function of 16-bit timer is as follows ;

#### Figure 6-3-1 Count Timing of Timer Operation (Timer 4)

- (A) Set the value to the timer 4 compare register (TM4OC).
- (B) If the TM4EN flag is "1", the binary counter starts counting from x'0000'. The counting is happened at the falling edge of the count clock. But the binary counter doesn't count up at the first falling edge of the count clock.
- (C) If the binary counter reaches the value of the compare register, the interrupt request flag is set at the next count clock, and the binary counter is cleared to x'0000' to restart counting up.
- (D) If the TM4EN flag is "0", the binary counter is stopped <u>after 1 counting up</u>.

When the binary counter reaches the value in the compare register, the interrupt request flag is set and the binary counter is cleared, at the next count clock. So, set the compare register as : Compare register setting = (count till the interrupt request - 1)

If the interrupt is enabled, the timer interrupt request flag should be cleared before timer operation is started.

If the set value of the compare register (TM4OC) is smaller than that of the binary counter (TM4BC) during the count operation, the binary counter counts up to the overflow, at first.

Even if the TM4EN flag of the timer 4 is cleared during operation, it does not stop until the next count clock. Therefore, during max. 1 count clock after the TM4EN is cleared, the binary counter cannot be initialized.

### 6-3-2 Setup Example

#### ■Timer Operation Setup Example (Timer 4)

Timer 4 generates an interrupt constantly for timer function. Fosc (fosc=20 MHz at operation) is selected as a clock source to generate an interrupt every 1000 cycles (50 µs).

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul><li>(1) Stop the counter.</li><li>TM4MD (x'3F84')</li><li>bp6 : TM4EN = 0</li></ul>	(1) Set the TM4EN flag of the timer 4 mode register (TM4MD) to "0" to stop timer 4 counting.
<ul> <li>(2) Select the normal timer operation. TM4MD (x'3F84')</li> <li>bp5 : TM4PWM = 0</li> </ul>	(2) Set the TM4PWM flag of the TM4MD register to "0" to select the normal timer operation.
<ul><li>(3) Select the count clock source.</li><li>TM4MD (x'3F84')</li><li>bp2-0 : TM4CK2-0 = 000</li></ul>	<ul><li>(3) Select fosc as a clock source by the TM4CK2-</li><li>0 flag of the TM4MD register.</li></ul>
<ul><li>(4) Set the interrupt generation cycle. TM4OC (x'3F75', x'3F74')=x'03E7</li></ul>	<ul> <li>(4) Set the interrupt generation cycle to the timer 4 compare register (TM4OC). The cycle is 1000. The set value should be 1000-1=999(x'03E7').</li> </ul>
(5) Set the interrupt level. TM4ICR (x'3FEF') bp7-6 : TM4LV1-0 = 10	<ul> <li>(5) Set the interrupt level by the TM4LV1-0 flag of the timer 4 interrupt control register (TM4ICR).</li> <li>If any interrupt request flag had already been set, clear it.</li> <li>[ C&gt; Chapter 3 3-1-4. Interrupt Flag Setup ]</li> </ul>
<ul> <li>(6) Enable the interrupt.</li> <li>TM4ICR (x'3FEF')</li> <li>bp1 : TM4IE = 1</li> </ul>	<ul><li>(6) Set the TM4IE flag of the TM4ICR register to "1" to enable the interrupt.</li></ul>
<ul> <li>(7) Start the timer operation.</li> <li>TM4MD (x'3F84')</li> <li>bp6 : TM4EN = 1</li> </ul>	<ul><li>(7) Set the TM4EN flag of the TM4MD register to "1" to start timer 4.</li></ul>

TM4BC counts up from x'0000'. When TM4BC reaches the set value of the TM4OC register, the timer 4 interrupt request flag is set to "1" at the next count clock and the TM4BC becomes x'0000' and counts up, again.

When the TM4EN flag of the TM4MD register is changed at the same time to other bit, binary counter may count up by the switching operation.

If the value of the TM4OCH and TM4OCL register are rewritten when the timer 4 is stopped, the timer 4 binary counter becomes x'0000'.

But, even if the TM4EN flag of the operating timer is cleared to "0", it doesn't stop until the count edge of the next clock. Therefore, during max. 1 count clock after the TM4EN is cleared, the binary counter cannot be initialized.

# 6-4 16-Bit Event Count

### 6-4-1 Operation

Event count operation has 2 types ; TM4IO input and synchronous TM4IO input can be selected as the count clock.

### ■16-Bit Event Count Operation (Timer 4)

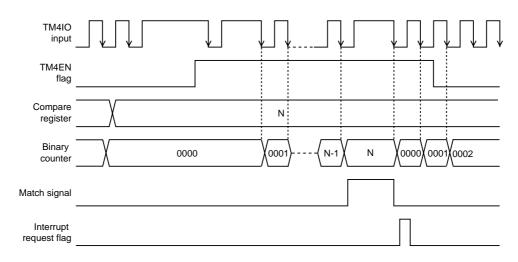

Event count means that the binary counter (TM4BC) counts the input signal from external to the TM4IO pin. If the value of the binary counter reaches the setting value of the compare register (TM4OC), interrupts can be generated at the next count clock.

	Timer 4
Event input	TM4IO input (P14)
	Synchronous TM4IO input

Table 6-4-1 Event Count Input Clock Source

#### Count Timing of TM4IO Input (Timer 4)

When TM4IO input is selected, TM4IO input signal is directly input to the count clock of the timer 4. The binary counter counts up at the falling edge of the TM4IO input signal.

If the binary counter is read at operation, incorrect data at counting up may be read. To prevent this, use the event count by the synchronous TM4IO input as the following page.

#### Count Timing of Synchronous TM4IO Input (Timer 4)

If the synchronous TM4IO input is selected, the synchronizing circuit output signal is input to the count clock. The synchronizing circuit output signal is changed at the falling edge of the system clock after the TM4IO input signal is changed. The binary counter counts up at the falling edge of the synchronizing circuit output signal or the synchronizing circuit output signal that passed through the divide-by circuit.

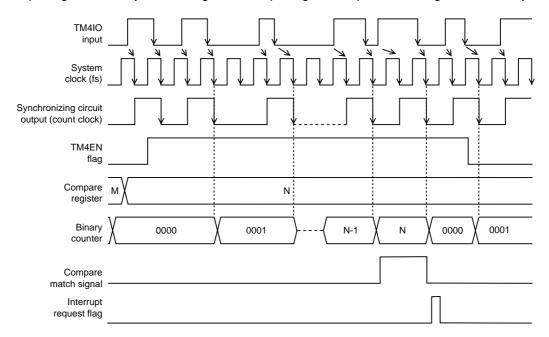

Figure 6-4-2 Count Timing of Synchronous TM4IO Input (Timer 4)

When the synchronous TM4IO input is selected as the count clock source, the timer 4 counter counts up in synchronization with system clock, therefore the correct value is always read.

But, if the synchronous TM4IO is selected as the count clock source, CPU mode cannot return from STOP/HALT mode.

## 6-4-2 Setup Example

### ■Event Count Setup Example (Timer 4)

If the falling edge of the TM4IO input pin signal is detected 5 times using timer 4, an interrupt is generated.

An example setup procedure, with a description of each step is shown below.

Setup Procedure		Description	
(1)	Stop the counter. TM4MD (x'3F84') bp6 : TM4EN = 0	(1)	Set the TM4EN flag of the timer 4 mode register (TM4MD) to "0" to stop timer 4 counting.
(2)	Select the normal timer operation. TM4MD (x'3F84') bp5 : TM4PWM = 0	(2)	Set the TM4PWM flag of the TM4MD register to "0" to select the normal timer operation.
	Set the special function pin to input mode. P1DIR (x'3F31') bp4 : P1DIR4 = 0	(3)	Set the P1DIR4 flag of the port 1 direction control register (P1DIR) to "0" to set P14 pin to input mode. If it needs, pull up resistor should be added. [ CP Chapter 4 I/O Ports ]
(4)	Select the count clock source. TM4MD (x'3F84') bp2-0 : TM4CK2-0 = 011	(4)	Select the TM4IO input as a clock source by the TM4CK2-0 flag of the TM4MD register.
. ,	<ul><li>(5) Set the interrupt generation cycle. TM4OC (x'3F75', x'3F74')=x'0004'</li></ul>		Set the interrupt generation cycle to the timer 4 compare register (TM4OC). The set value should be 4, because the counting is 5 times.
(6)	Set the interrupt level. TM4ICR (x'3FEF') bp7-6 :TM4LV1-0 = 10	(6)	Set the interrupt level by the TM4LV1-0 flag of the timer 4 interrupt control register (TM4ICR). If any interrupt request flag had already been set, clear it.
			[ C Chapter 3 3-1-4. Interrupt Flag Setup ]

Setup Procedure	Description
<ul> <li>(7) Enable the interrupt.</li> <li>TM4ICR (x'3FEF')</li> <li>bp1 : TM4IE = 1</li> </ul>	<ul><li>(7) Set the TM4IE flag of the TM4ICR register to "1" to enable interrupt.</li></ul>
<ul> <li>(8) Start the event count.</li> <li>TM4MD (x'3F84')</li> <li>bp6 : TM4EN = 1</li> </ul>	(8) Set the TM4EN flag of the TM4MD register to "1" to start timer 4.

Every time TM4BC detects the falling edge of TM4IO input, TM4BC counts up from 'x0000'. When TM4BC reaches the setting value of theTM4OC register, the timer 4 interrupt request flag is set at the next count clock, then the value of TM4BC becomes x'0000' and counting up is restarted.

# 6-5 16-Bit Timer Pulse Output

### 6-5-1 Operation

TM4IO pin can output a pulse signal with any frequency.

■Operation of 16-Bit Timer Pulse Output (Timer 4)

The timers can output 2 x cycle signal, compared to the setting value in the compare register (TM4OC). Output pins are as follows ;

	Timer 4
Pulse output pin	TM4IO output (P14)

■Count Timing of Timer Pulse Output (Timer 4)

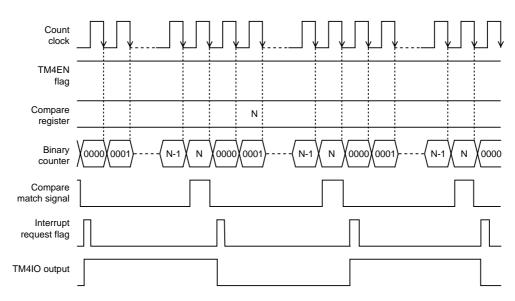

Figure 6-5-1 Count Timing of Timer Pulse Output (Timer 4)

The TM4IO pin outputs 2 x cycle, compared to the value in the compare register. If the binary counter reaches the compare register, and the binary counter is cleared to x'0000', TM4IO output (timer output) is inverted. The inversion of the timer output is changed at the rising edge of the count clock. This is happened to form the waveform inside to correct the output cycle.

In the initial state after releasing reset, the timer pulse output is low output.

### 6-5-2 Setup Example

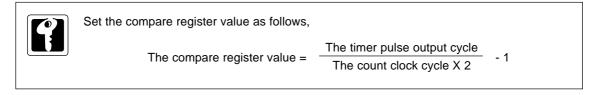

### ■Timer Pulse Output Setup Example (Timer 4)

TM4IO pin outputs 50 kHz pulse by using timer 4. For this, select fosc as clock source, and set a 1/2 cycle (100 kHz) for the timer 4 compare register (at fosc=20 MHz).

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul> <li>(1) Stop the counter.</li> <li>TM4MD (x'3F84')</li> <li>bp6 : TM4EN = 0</li> </ul>	<ol> <li>Set the TM4EN flag of the timer 4 mode register (TM4MD) to "0" to stop timer 4 counting.</li> </ol>
<ul> <li>(2) Set the special function pin to output mode.</li> <li>P1OMD (x'3F39')</li> <li>bp4 : P14TCO = 1</li> <li>P1DIR (x'3F31')</li> <li>bp4 : P1DIR4 = 1</li> </ul>	<ul> <li>(2) Set the P14TCO flag of the port 1 output mode register (P10MD) to "1" to set P14 pin as the special function pin. Set the P1DIR4 flag of the port 1 direction control register (P1DIR) to "1" to set output mode.</li> <li>If it needs, pull-up resister should be added.</li> <li>[ CP Chapter 4 I/O Ports ]</li> </ul>
<ul> <li>(3) Select the normal timer operation. TM4MD (x'3F84')</li> <li>bp5 : TM4PWM = 0</li> </ul>	(3) Set the TM4PWM flag of the timer 4 mode register (TM4MD) to "0" to select the normal timer operation.
<ul><li>(4) Select the count clock source. TM4MD (x'3F84')</li><li>bp2-0 : TM4CK2-0 = 000</li></ul>	(4) Select fosc as a clock source by the TM4CK1-0 flag of the TM4MD register.
(5) Set the timer pulse output cycle. TM4OC (X'3F75', X'3F74')=x'00C7'	<ul> <li>(5) Set the 1/2 frequency of the timer pulse output cycle to the timer 4 compare register</li> <li>(TM4OC). To be 100 kHz by a divided 20 MHz, set as follows ;</li> <li>200 - 1 = 199 (x'C7')</li> </ul>
<ul> <li>(6) Start the timer operation.</li> <li>TM4MD (x'3F84')</li> <li>bp6 : TM4EN = 1</li> </ul>	<ul><li>(6) Set the TM4EN flag of the TM4MD register to "1" to start timer 4.</li></ul>

TM4BC counts up from x'0000'. If TM4BC reaches the set value of the TM4OC register and TM4BC is cleared to x'0000', the signal of the TM4IO output is inverted and TM4BC counts up from x'0000', again.

# 6-6 Added Pulse Type 16-Bit PWM Output

### 6-6-1 Operation

In the added pulse method 16-bit PWM output, a 1-bit output is appended to the basic component of the 8-bit PWM output, and the output is from TM4IO. Precise 16-bit control is possible based on the number of PWM repetitions (256 times) to which this bit is appended.

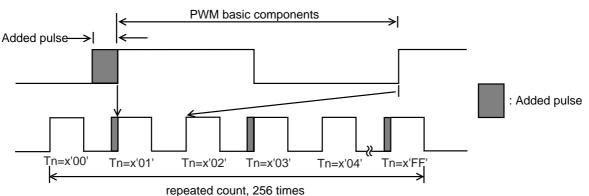

■Added Pulse Type 16-Bit PWM Output (Timer 4)

The lower 8 bits of the compare register (TM4OCL) set the duty ("H" period) of the basic PWM waveform and the upper 8 bits of the compare register (TC4OCH) set the added pulse position. The cycle of the basic PWM waveform is the period of the full count overflow in the lower 8 bits of the binary counter (TM4BCL). Table 6-6-1 shows the PWM output pin.

Table 6-6-1	PWM Output Pin
-------------	----------------

	Timer 4
PWM output pin	TM4IO output pin (P14)

### ■Added Pulse Type PWM Output (Timer 4)

repeated count, 200 times

Figure 6-6-1 Added Pulse Type PWM Output

Set the P1DIR register and the P1PLU register, when the P14 pin is used as a PWM output pin.

For PWM operation, x'FF' in TM4OCL produces the same result as x'00' : constant low level output at the PWM4 pin, not constant high. Do not set x'FF' in TM4OCL.

#### ■Setting the Added Pulse Position

The upper 8 bits of timer 4 compare register (TM4OCH) set the position of the added pulse. If the TM4OCH register is set to x'00', an additional bit is not appended to the basic PWM component. If the TM4OCH register is set to x'FF', an additional bit is repeatedly appended to the 255 basic PWM components during the cycle. The relation between the value set in the TM4OCH register and the position of the added pulse is shown in the table below.

In the TM4OCH register, the position of the added pulse (the value of Tn) depends which bit has "1". And the number of the setting value in TM4OCH is the number of bits to be added. For example, if x'03' is set in the TM4OCH register (set "1" in bp0 and bp1), bits are appended to pulse positions for x'01' (Tn=x'80") and x'02' (Tn=x'40', x'C0'), shown in the below table.

The setting value of TM4OCH	Position of the added pulse (the value of Tn)
0 0 0 0 0 0 0 0 0 (x'00')	none
0 0 0 0 0 0 0 0 1 (x'01')	x'80'
0 0 0 0 0 0 0 1 0 (x'02')	x'40',x'C0'
0 0 0 0 0 1 0 0 (x'04')	x'20',x'60',x'A0',x'E0'
0 0 0 0 1 0 0 0 (x'08')	x'10',x'30',x'50',x'70',x'90',x'B0',x'D0',x'F0'
0 0 0 1 0 0 0 0 (x'10')	x'08',x'18',x'28',x'38',x'48',x'58', ,x'E8',x'F8'
0 0 1 0 0 0 0 0 (x'20')	x'04',x'0C',x'14',x'1C',x'24',x'2C, ,x'F4',x'FC'
0 1 0 0 0 0 0 0 0 (x'40')	x'02',x'06',x'0A',x'0E',x'12',x'16, ,x'FA',x'FE'
1 0 0 0 0 0 0 0 0 (x'80')	x'01',x'03',x'05',x'07',x'09',x'0B, ,x'FD',x'FF'
(bp7) (bp0)	

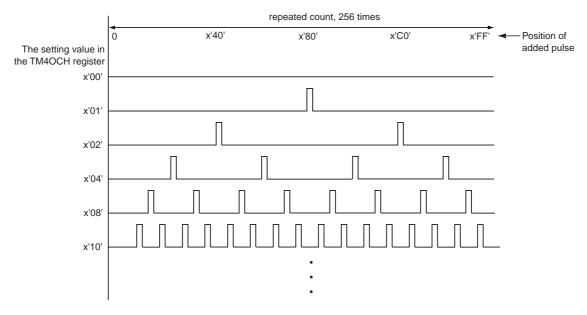

Figure 6-6-2 The Setting Value in The TM4OCH Register and The Position of The Added Pulse

### 6-6-2 Setup Example

### ■Added Pulse Type 16-Bit PWM Output Setup Example (Timer 4)

The TM4IO output pin outputs the 1/4 duty (64 :192) PWM output waveform at 78.125 kHz with timer 4. In the PWM output repetitions (256 times), the added pulse is appended 7 times and the duty becomes 65 : 191. The high frequency oscillation (fosc) is set to be operated at 20 MHz.

	Setup Procedure		Description
(1) S	Stop the counter. TM4MD (x'3F84') bp6 : TM4EN = 0	(1)	Set the TM4EN flag of the timer 4 mode register (TM4MD) to "0" to stop timer 4 counting.
. ,	Set the special function pin to output node. P1OMD (x'3F39') bp4 : P14TCO = 1 P1DIR (x'3F31') bp4 : P1DIR4 = 1	(2)	Set the P14TCO flag of the port 1 output mode register (P1OMD) to "1" to set the P14 pin as a special function pin. Set the P1DIR4 flag of the port 1 direction control register (P1DIR) to "1" to set output mode. If it needs, pull-up resister should be added. [ C Chapter 4 I/O Ports ]
(3) S	Select the count clock source. TM4MD (x'3F84') bp2-0 : TM4CK2-0 = 000	(3)	Select fosc as a clock source by the TM4CK2-0 flag of the TM4MD register.
(4) S	Set the PWM operation. TM4MD (x'3F84') bp5 : TM4PWM = 1	(4)	Set the TM4PWM flag of the timer 4 mode register (TM4MD) to "1" to select the PWM operation.
. ,	Set the PWM output "H" period and the location of the added pulse. TM4OC(x'3F75', x'3F74') = x'0740'	(5)	Set the "H" period of the PWM output in the lower 8 bits of the timer 4 compare register (TM4OCL). To be 1/4 duty of the full count 256 of the lower 8 bits in the timer 4 binary counter (TM4BCL), the setting value should be 256 / 4 = 64 (x'40'). Also set the location of the added pulse in the upper 8 bits of the compare register. If it is set to x'07', the added pulse is appended 7 times in 256 repetitions.

Setup Procedure	Description	
<ul> <li>(6) Start the timer operation.</li> <li>TM4MD (x'3F84')</li> <li>bp6 : TM4EN = 1</li> </ul>	<ul><li>(6) Set the TM4EN flag of the TM4MD register to "1" to start timer 4.</li></ul>	

TM4BCL counts up from x'00'. The PWM source waveform outputs "H" until TM4BCL reaches the set value of the TM4OCL register, then, after the match it outputs "L". After that, TM4BCL continues to count up, once a overflow happens, the PWM source waveform outputs "H" again, and TM4BCL counts up from x'00', again.

From the above setting, the basic PWM waveform becomes 64 : 192. And the TM4OCH is set to x'07', in the PWM output repetitions (256 times), the added pulse is appended 7 times and the duty becomes 65 : 191.

For PWM operation, x'FF' in TM4OCL produces the same result as x'00' : constant low level output at the PWM4 pin, not constant high. Do not set x'FF' in TM4OCL.

Use a 16-bit access instruction to set the TM4OCH, TM4OCL register.

# 6-7 16-Bit Timer Synchronous Output

### 6-7-1 Operation

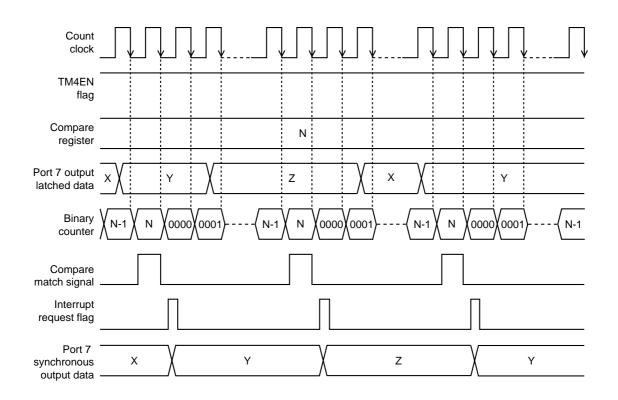

When the binary counter of the timer reaches the set value of the compare register, the latched data is output from port 7 at the next count clock.

Synchronous Output Operation by 16-Bit timer (Timer 4)

The port 7 latched data is output from the output pin at the interrupt request generation by the match of the binary counter (TM4OC) and the compare register.

Only port 7 can perform synchronous output operation, and individual pins can be set.

Count Timing of Synchronous Output (Timer 4)

#### Figure 6-7-1 Count Timing of Synchronous Output (Timer 4)

The port 7 latched data is output from the output pin in synchronization with the interrupt request generation by the match of binary counter and compare register.

Even if the port 7 is used as a synchronous output pin, the setting of the P7DIR register is necessary.

### 6-7-2 Setup Example

#### ■Synchronous Output Setup Example (Timer 4)

Setup example that latched data of port 7 is output constantly (100  $\mu$ s) by using timer 4 from the synchronous output pin is shown below. The clock source of timer 4 is selected fs/4 (at fosc=8 MHz). An example setup procedure, with a description of each step is shown below.

	Setup Procedure		Description
(1)	Stop the counter. TM4MD (x'3F84') bp6 : TM4EN = 0	(1)	Set the TM4EN flag of the timer 4 mode register (TM4MD) to "0" to stop timer 4 counting.
(2)	Select the synchronous output event. FLOAT2 (x'3F4C') bp1-0 : P7SYEVS2-1 = 01	(2)	Set the P7SYEVS2-1 flag of the pin control register 2 (FLOAT2) to "01" to set the synchronous output event to the timer 4 interrupt.
(3)	Set the synchronous output pin. SYSMD (x'3F1F') = x'FF' P7DIR (x'3F37') = x'FF'	(3)	Set the synchronous output control register (SYSMD) to x'FF' to set the synchronous output pin. (P77 to P70 : Synchronous output pin) Set the port 7 direction control register (P7DIR) to x'FF' to set port 7 to output pin.
			[ CP Chapter 4 I/O Ports ]
(4)	Select the count clock source. TM4MD (x'3F84') bp2-0 : TM4CK2-0 = 001	(4)	Select fs/4 as a clock source by the TM4CK2-0 flag of the TM4MD register.
(5)	Select the normal timer operation. TM4MD (x'3F84') bp5 : TM4PWM = 0	(5)	Set the TM4PWM flag of the TM4MD register to "0" to select the normal timer operation.
(6)	Set the synchronous output event generation cycle. TM4OC (x'3F75',x'3F74')=x'0063'	(6)	Set the synchronous output event generation cycle to the timer 4 compare register (TM4OC). To be 10 kHz by dividing 1 MHz, set as follows ; 100 - 1 = 99 (x'0063')
(7)	Start the timer operation. TM4MD (x'3F84') bp6 : TM4EN = 1	(7)	Set the TM4EN flag of the TM4MD register to "1" to start timer 4.

TM4BC counts up from x'0000'. If any data is written to the port 7 output register (P7OUT), TM4BC reaches the set value of TM4OC register and the synchronous output pin outputs data of port 7 in every time an interrupt request is generated.

When the port 7 synchronous output is disabled, the value of the synchronous output value storage register is not always same to the value of the port 7 output register (P7OUT). Therefore, the pin output may be changed at the switching from the general output to the synchronous output.

## 6-8 16-Bit Timer Capture

### 6-8-1 Operation

The value of a binary counter is stored to register at the timing of the external interrupt input signal.

Capture Operation with External Interrupt Signal as a Trigger (Timer 4)

Capture trigger of input capture function is generated at the external interrupt signal that passed through the external interrupt interface block. The capture trigger is selected by the timer 4 mode register (TM4MD) and the external interrupt control register (IRQ0ICR, IRQ1ICR, IRQ2ICR).

Here are the capture trigger to be selected and the interrupt flag setup.

Capture trigger source	Timer 4 mode register	External interrupt n control register (IRQnICR)	Interrupt starting edge of external interrupt n
	T4ICTS1-0	REDGn (bp5)	
Disable input capture	00	-	-
IRQ0 falling edge	01(IRQ0)	0	IRQ0 falling edge
IRQ0 rising edge	01(IRQ0)	1	IRQ0 rising edge
IRQ1 falling edge	10(IRQ1)	0	IRQ1 falling edge
IRQ1 rising edge	10(IRQ1)	1	IRQ1 rising edge
IRQ2 falling edge	11(IRQ2)	0	IRQ2 falling edge
IRQ2 rising edge	11(IRQ2)	1	IRQ2 rising edge

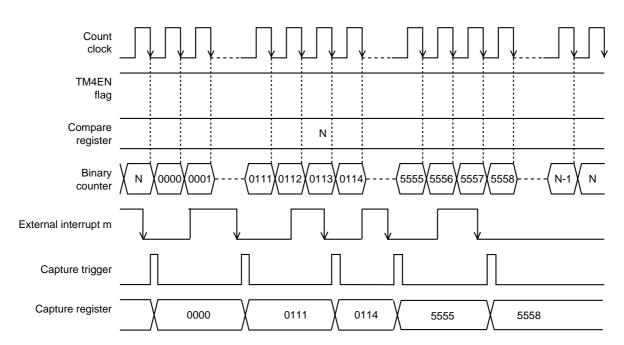

Table 6-8-1 Capture Trigger

An interrupt request and a capture trigger are generated at switching the active edge of an external interrupt by program, when the setup is as follows ;

- (1) at switching the active edge from the falling to the rising, when the interrupt pin is "H" level.
- (2) at switching the active edge from the rising to the falling, when the interrupt pin is "L" level.

Operate the interrupt flag with regard to the noise influence on the program.

[ C Chapter 3 3-3-4. Programmable Active Edge Interrupt ]

Capture Count Timing at Falling Edges of External Interrupt Signal is selected as a Trigger (Timer 4)

# Figure 6-8-1 Capture Count Timing at an External Interrupt Signal is selected as a Trigger (Timer 4)

A capture trigger is generated at the falling edges of the external interrupt m input signal. At the same timing, the value of a binary counter is stored to the input capture register. A capture trigger is generated only at the edge that is specified as a capture trigger source. The other count timing is same to the count timing of the timer operation.

When the binary counter is used as a free counter that counts x'0000' to x'FFFF', set the compare register to x'FFFF'.

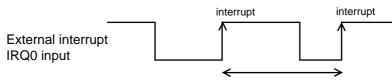

If a capture trigger is generated before the value of the input capture register is read, the value of the input capture register can be rewritten.

### 6-8-2 Setup Example

■Capture Function Setup Example (Timer 4)

Pulse width measurement is enabled by storing the value of the binary counter to the capture register at the interrupt generation edge of the external interrupt 0 input signal with timer 4. The interrupt generation edge is specified to be the rising edge.

An example setup procedure, with a description of each step is shown below.

Pulse width to be measured

Figure 6-8-2 Pulse Width Measurement of External Interrupt 0

	Setup Procedure		Description
(1)	Stop the counter. TM4MD (x'3F84') bp6 : TM4EN = 0	(1)	Set the TM4EN flag of the timer 4 mode register (TM4MD) to "0" to stop timer 4 counting.
(2)	Select the count clock source. TM4MD (x'3F84') bp2-0 : TM4CK2-0 = 000	(2)	Select fosc as clock source by the TM4CK2-0 flag of the TM4MD register.
(3)	Select the capture trigger generation interrupt source. TM4MD (x'3F84') bp4-3 : T4ICTS1-0 = 01	(3)	Select the external interrupt 0 (IRQ0) input as a generation source of capture trigger by the T4ICTS1-0 flag of the TM4MD register.
(4)	Select the interrupt generation active edge. IRQ0ICR (x'3FE2') bp5 : REDG0 = 1	(4)	Set the REDG0 flag of the external interrupt 0 control register (IRQ0ICR) to "1" to select the rising edge as the interrupt generation active edge.
(5)	Select the normal timer operation. TM4MD (x'3F84') bp5 : TM4PWM = 0	(5)	Set the TM4PWM flag of the timer 4 mode register (TM4MD) to "0" to select the normal timer operation.
(6)	Set the compare register. TM4OC(x'3F75',x'3F74') = x'FFFF'	(6)	Set the timer 4 compare register (TM4OCH, TM4OCL) to x'FFFF'. At that time, the timer 4 binary counter (TM4BC) is initialized to x'0000'.

Setup Procedure	Description	
<ul> <li>(7) Set the interrupt level.</li> <li>IRQ0ICR (x'3FE2')</li> <li>bp7-6 : IRQ0LV1-0= 10</li> </ul>	<ul> <li>(7) Set the interrupt level by the IRQ0LV1-0 flag of the IRQ0ICR register.</li> <li>If any interrupt request flag had already been set, clear it.</li> <li>[ C Chapter 3 3-1-4. Interrupt Flag Setup ]</li> </ul>	
<ul> <li>(8) Enable the interrupt.</li> <li>IRQ0ICR (x'3FE2')</li> <li>bp1 : IRQ0IE = 1</li> </ul>	(8) Enable the interrupt by setting the IRQ0IE flag of the IRQ0ICR register to "1".	
<ul> <li>(9) Start the timer operation.</li> <li>TM4MD (x'3F84')</li> <li>bp6 : TM4EN = 1</li> </ul>	<ul><li>(9) Set the TM4EN flag of the TM4MD register to "1" to start timer 4.</li></ul>	

TM4BC counts up from x'0000'. At the timing of the rising edge of the external interrupt 0 input signal, the value of TM4BC is stored to the TM4IC register.

At the above (7), (8), the IRQ0 interrupt is enabled, but input capture is available even if an interrupt is disabled. However, if an interrupt is enabled, the pulse width between rising edges of the external interrupt input signal can be measured by reading the value of TM4IC register by the interrupt service routine, and by calculating the margin of the capture values (the values of the TM4IC register).

# Chapter 7 Time Base Timer / 8-Bit Free-running Timer 7

# 7-1 Overview

This LSI has a time base timer and a 8-bit free-running timer (timer 5).

Time base timer is a 13-bit timer counter. These timers stop the timer counting only at standby mode (STOP mode).

### 7-1-1 Functions

Table 7-1-1 shows the clock sources and the interrupt generation cycles that timer 5 and time base timer can select.

	Time base timer	Timer 5 (8-Bit free-running timer)
Timer operation		√
Interrupt source	TBIRQ	TM5IRQ
Clock source	fosc fx	fosc fs/4 fx fosc X 1/2 <sup>13</sup> (*1) fx X 1/2 <sup>13</sup> (*2)

#### Table 7-1-1 Clock Source and Generation Cycle

### 7-1-2 Block Diagram

■Timer 5, Time Base Timer Block Diagram

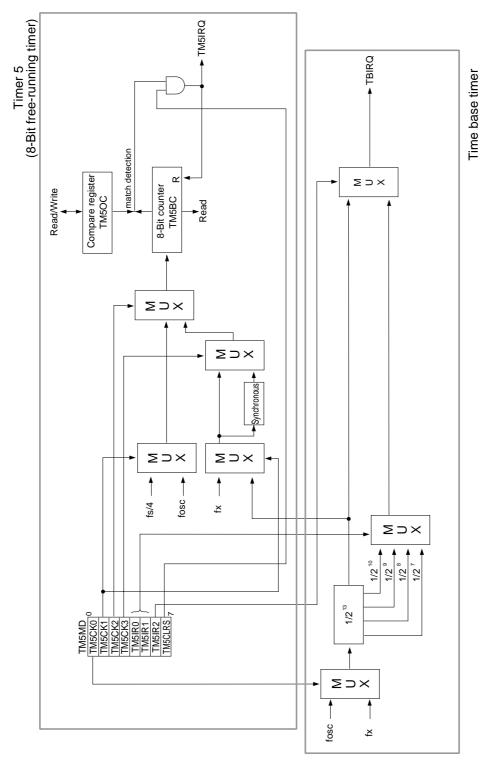

Figure 7-1-1 Block Diagram (Timer 5, Time Base Timer)

# 7-2 Control Registers

Timer 5 consists of binary counter (TM5BC), compare register (TM5OC), and is controlled by mode register (TM5MD). Time base timer is controlled by mode register (TM5MD), too.

### 7-2-1 Control Registers

Table 7-2-1 shows the registers that control timer 5, time base timer.

	Register	Address	R/W	Function	Page
	TM5BC	x'03F68'	R	Timer 5 binary counter	VII - 5
Timor 5	TM5OC	x'03F78'	R/W	Timer 5 compare register	VII - 5
Timer 5	TM5MD	x'03F88'	R/W	Timer 5 mode register	VII - 6
	TM5ICR	x'03FF0'	R/W	Timer 5 interrupt control register	III - 27
Timer base timer	TM5MD	x'03F88'	R/W	Timer 5 mode register	VII - 6
	TBICR	x'03FE7'	R/W	Time base interrupt control register	III - 28

#### Table 7-2-1 Control Registers

R/W : Readable / Writable

R : Readable only

### 7-2-2 Programmable Timer Registers

Timer 5 is a 8-bit programmable counter.

Programmable counter consists of compare register (TM5OC) and binary counter (TM5BC).

Binary counter is a 8-bit up counter. When the TM5CLRS flag of the timer 5 mode register (TM5MD) is "0" and the interrupt cycle data is written to the compare register (TM5OC), the timer 5 binary counter (TM5BC) is cleared to x'00'.

■Timer 5 Binary Counter (TM5BC)

Figure 7-2-1 Timer 5 Binary Counter (TM5BC : x'03F68', R)

■Timer 5 Compare Register (TM5OC)

Figure 7-2-2 Timer 5 Compare Register (TM5OC : x'03F78', R/W)

### 7-2-3 Timer Mode Registers

This is a readable / writable register that controls timer 5 and time base timer.

#### ■Timer 5 Mode Register (TM5MD)

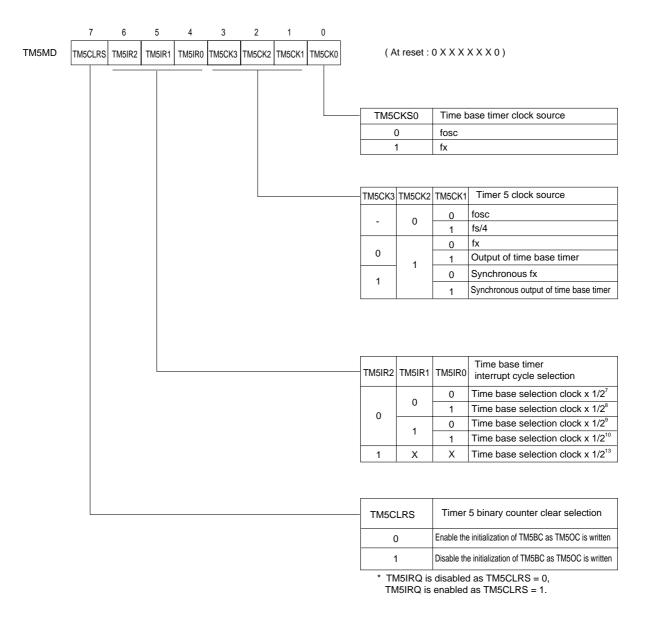

Figure 7-2-3 Timer 5 Mode Register (TM5MD : x'03F88', R/W)

# 7-3 8-Bit Free-running Timer

### 7-3-1 Operation

#### ■8-Bit Free-running Timer (Timer 5)

The generation cycle of timer interrupts is set by the clock source selection and the setting value of the compare register (TM5OC), in advance. If the binary counter (TM5BC) reaches the setting value of the compare register, an interrupt is generated at the next count clock, then binary counter is cleared and counting is restarted from x'00'.

Table 7-3-1 shows clock source that can be selected.

Clock source	One count time
fosc	50 ns
fs/4	400 ns
fx	30.5 µs
fosc X 1/2 <sup>13</sup>	409.6 µs
fx X 1/2 <sup>13</sup>	250 ms
fosc = $20(MHz)$ fx = $32.768(kHz)$ calculated as fs = fosc/2 = $10 MHz$	

#### Table 7-3-1 Clock Source at Timer Operation (Timer 5)

Timer 5 cannot stop its timer counting except at standby mode (STOP mode).

■8-bit Free-running Timer as a 1 minute-timer, a 1 second-timer

Table 7-3-2 shows the clock source selection and the TM5OC register setup, when a 8-bit free-running timer is used as a 1 minute-timer, a 1 second-timer.

Interrupt Generation Cycle	Clock Source	TM5OC Register
1 min	fx x 1/2 <sup>13</sup>	X'EF'
	fx x 1/2 <sup>10</sup>	X'1F'
1 s –	fx x 1/2 <sup>13</sup>	X'03'
fx = 32.768(kHz)		

Table 7-3-2 1 minute-timer, 1 second-timer Setup (Timer 5)

When the 1 minute-timer (1 min.) is set on Table 7-3-2, the bp1 waveform frequency (cycle) of the TM5BC register is 1 Hz (1 s). So, that can be used for adjusting the seconds.

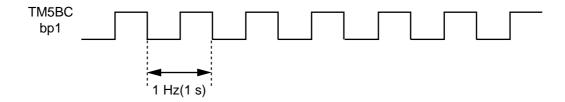

Figure 7-3-1 Waveform of TM5BC Register bp1 (Timer 5)

#### ■Count Timing of Timer Operation (Timer 5)

Binary counter counts up with the selected clock source as a count clock.

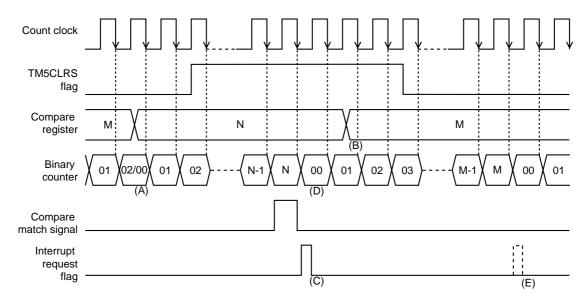

Figure 7-3-2 Count Timing of Timer Operation (Timer 5)

- (A) When any data is written to the compare register as the TM5CLRS flag is "0", the binary counter is cleared to x'00'.
- (B) Even if any data is written to the compare register as the TM5CLRS flag is "1", the binary counter is not changed.
- (C) When the binary counter reaches the value of the compare register as the TM5CLRS flag is "1", an interrupt request flag is set at the next count clock.
- (D) When an interrupt request flag is set, the binary counter is cleared to x'00' and restarts the counting.
- (E) Even if the binary counter reaches the value of the compare register as the TM5CLRS flag is "0", no interrupt request flag is set.

When the binary counter reaches the value in the compare register, the interrupt request flag is set and the binary counter is cleared, at the next count clock. So, set the compare register as : Compare register setting = (count till the interrupt request - 1)

If fx is selected as the count clock source in timer 5, when the binary counter is read at operation, uncertain value on counting up may be read. To prevent this, select the synchronous fx as the count clock source.

But, if the synchronous fx is selected as the count clock source, CPU mode cannot return from STOP/HALT mode.

If the compare register is set the smaller value than the binary counter's during the count operation, the binary counter counts up to the overflow, at first.

### 7-3-2 Setup Example

#### ■Timer Operation Setup (Timer 5)

Timer 5 generates an interrupt constantly for timer function. fs/4 (fosc=20 MHz) is selected as a clock source to generate an interrupt every 250 dividing (100  $\mu$ s).

An example setup procedure, with a description of each step is shown below.

	Setup Procedure		Description
. ,	Enable the binary counter initialization. TM5MD (x'3F88') bp7 : TM5CLRS = 0	(1)	Set the TM5LRS flag of the timer 5 mode register (TM5MD) to "0". At that time, the initialization of the timer 5 binary counter (TM5BC) is enabled.
(2) 5	Select the clock source. TM5MD (x'3F88') bp3-1 : TM5CK3-1 = 001	(2)	Clock source can be selected by the TM5CK3-1 flag of the TM5MD register. Actually, fs/4 is selected.
(3) 5	Set the interrupt generation cycle. TM5OC (X'3F78') = x'F9'	(3)	Set the interrupt generation cycle to the timer 5 compare register (TM5OC). At that timer, TM5BC is initialized to x'00'.
. ,	Enable the interrupt request generation. TM5MD (x'3F88') bp7 : TM5CLRS = 1	(4)	Set the TM5CLRS flag of the TM5MD register to "1" to enable the interrupt request generation.
(5) \$	Set the interrupt level. TM5ICR (x'3FF0') bp7-6 : TM5LV1-0 = 01	(5)	Set the interrupt level by the TM5LV1-0 flag of the timer 5 interrupt control register (TM5ICR). If any interrupt request flag had already been set, clear it.
(6) E	Enable the interrupt. TM5ICR (x'3FF0') bp1 : TM5IE = 1	(6)	[CP Chapter 3 3-1-4. Interrupt Flag Setup ] Set the TM5IE flag of the TM5ICR register to "1" to enable the interrupt.

\* the above steps (1), (2) can be set at once.

As TM5OC is set, TM5BC is initialized to x'00' to count up. When TM5BC matches TM5OC, the timer 5 interrupt request flag is set at the next count clock and TM5BC is cleared to x'00' to restart counting.

If the interrupt is enabled, the timer 5 interrupt request flag should be cleared before timer 5 operation is started.

If the TM5CLRS flag of the TM5MD register is set to "0", TM5BC can be initialized in every rewriting of TM5OC register, but in that state the timer 5 interrupt is disabled. If the timer 5 interrupt should be enabled, set the TM5CLRS flag to "1" after rewriting the TM5OC register.

On the timer 5 clock source selection, either the time base timer output or the time base timer synchronous output is selected, the clock setup of time base timer is necessary.

# 7-4 Time Base Timer

### 7-4-1 Operation

■Time Base Timer (Time Base Timer)

The Interrupt is constantly generated.

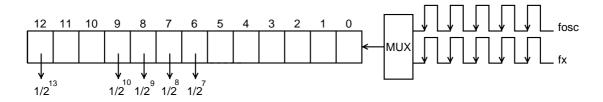

Table 7-4-1 shows the interrupt generation cycle in combination with the clock source ;

Selected clock source	Interrupt generation cycle		
	fosc X 1/27	6.4 µs	
	fosc X 1/2 <sup>8</sup>	12.8 µs	
fosc ( = 20 MHz )	fosc X 1/29	25.6 µs	
	fosc X 1/210	51.2 μs	
	fosc X 1/213	409.6 µs	
	fosc X 1/27	15.2 µs	
	fosc X 1/28	30.5 µs	
fosc ( = 8.39 MHz )	fosc X 1/29	61.0 µs	
	fosc X 1/2 <sup>10</sup>	122.0 µs	
	fosc X 1/2 <sup>13</sup>	976.4 µs	
	fx X 1/2 <sup>7</sup>	3.9 ms	
fx ( = 32.768 kHz)	fx X 1/2 <sup>8</sup>	7.8 ms	
	fx X 1/2 <sup>9</sup>	15.6 ms	
	fx X 1/2 <sup>10</sup>	31.2 ms	
	fx X 1/2 <sup>13</sup>	250 ms	

 Table 7-4-1
 Time Base Timer Interrupt Generation Cycle

#### ■Count Timing of Timer Operation (Time Base Timer)

The counter counts up with the selected clock source as a count clock.

#### Figure 7-4-1 Count Timing of Timer Operation (Time Base Timer)

When the selected interrupt cycle has passed, the interrupt request flag of the time base interrupt control register (TBICR) is set to "1".

An interrupt may be generated at switching of the clock source. Enable interrupt after switching the clock source.

Time base timer cannot stop the operation.

13-bit counter of time base timer can be initialized only at reset.

This LSI has built-in time base timer for digital clock. For example, if fx (= 32.768 kHz) is selected as clock source, interrupt request flag is set by 13-bit counter par 250 ms. However, the 13-bit counter can be initialized only at reset. Therefore, the first interrupt request flag is not always set after 250 ms.

Depending on counting condition, the first interrupt request flag is generated after 0 ms (minimum) to 250 ms (maximum). So, digital clock may gain 250 ms (maximum).

How to keep a error to a minimum, on setting for digital clock.

When fx ( = 32.768 kHz) is set as clock source, and the time base timer is used as digital clock ;

- Select fosc as clock source.
  - $\downarrow$
- Generate interrupt.
  - $\downarrow$
- During interrupt service routine, change clock source to fx, and initialize a digital clock.

### 7-4-2 Setup Example

#### ■Timer Operation Setup (Time Base Timer)

Time base timer generates an interrupt constantly in the selected interrupt cycle. The interrupt generation cycle is as  $fosc \times 1/2^{13}$  (as 0.976 ms : fosc = 8.39 MHz) for generation interrupts. An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul> <li>(1) Select the clock source.</li> <li>TM5MD (x'3F88')</li> <li>bp0 : TM5CK0 = 0</li> </ul>	<ol> <li>Select fosc as a clock source by the TM5CK0 flag of the timer 5 mode register (TM5MD).</li> </ol>
<ul> <li>(2) Select the interrupt generation cycle.</li> <li>TM5MD (x'3F88')</li> <li>bp6-4 : TM5IR2-0 = 100</li> </ul>	(2) Select the selected clock $\times$ 1/2 <sup>13</sup> as an interrupt generation cycle by the TM5IR2-0 flag of the TM5MD register.
<ul> <li>(3) Set the interrupt level.</li> <li>TBICR (x'3FE7')</li> <li>bp7-6 : TBLV1-0 = 01</li> </ul>	<ul> <li>(3) Set the interrupt level by the TBLV1-0 flag of the time base interrupt control register (TBICR).</li> <li>If any interrupt request flag had already been set, clear it.</li> </ul>
(4) Enable the interrupt. TBICR (x'3FE7') bp1 : TBIE = 1	<ul> <li>(4) Set the TBIE flag of the TBICR register to "1" to enable the interrupt.</li> <li>[ CP Chapter 3 3-1-4. Interrupt Flag Setup ]</li> </ul>

\* the above steps (1), (2) can be set at once.

When the selected interrupt generation cycle has passed, the interrupt request flag of the time base interrupt control register (TBICR) is set to "1".

# Chapter 8 Watchdog Timer

### 8-1 Overview

This LSI has a watchdog timer. This timer is used to detect software processing errors. It is controlled by the watchdog timer control register (WDCTR). And, once an overflow of watchdog timer is generated, a watchdog interrupt (WDIRQ) is generated. If the watchdog interrupt is generated twice, consecutively, it is regarded to be an indication that the software cannot execute in the intended sequence; thus, a system reset is initiated by the hardware (Reset pin outputs low level.).

### 8-1-1 Block Diagram

#### WDCTR, WDEN reset input R internal reset release fs/26 MUX fs/210 fs/214 R overflow overflow 1/218 WDIRQ fs 1/4 DLYCTR DLYS0 DLYS1 BUZCK0 1/212 BUZCK1 1/211 BUZOE buzzer MUX 1/210 $1/2^{9}$

■Watchdog Timer Block Diagram

Figure 8-1-1 Block Diagram (Watchdog Timer)

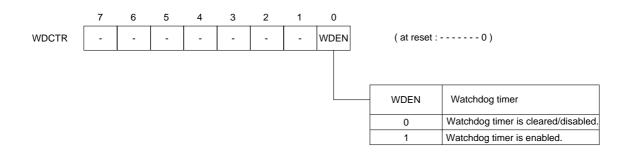

The watchdog timer is also used as a timer to count the oscillation stabilization wait time. This is used as a watchdog timer except at recovering from STOP mode and at reset releasing.

The watchdog timer is initialized at reset or at STOP mode, and counts system clock (fs) as a clock source from the initial value (x'0000'). The oscillation stabilization wait time is set by the oscillation stabilization control register (DLYCTR). After the oscillation stabilization wait, counting is continued as a watchdog timer. [ CP Chapter 2 2-5. Reset ]

# 8-2 Control Registers

The watchdog timer is controlled by the watchdog timer control register (WDCTR).

■Watchdog Timer Control Register (WDCTR)

# 8-3 Operation

### 8-3-1 Operation

The watchdog timer counts system clock (fs) as a clock source. If the watchdog timer overflows, the watchdog interrupt (WDIRQ) is generated as an non-maskable interrupt (NMI). At reset, the watchdog timer is stopped. The watchdog timer control register (WDCTR) sets if the watchdog timer is enabled or disabled.

If the watchdog interrupt (WDIRQ) is generated twice consecutively, it is regarded to be an indication that the software cannot execute in the intended sequence; thus, a system reset is initiated by the hardware (Reset pin outputs low level.).

#### ■Usage of Watchdog Timer

When the watchdog timer is used, constant clear in program is necessary to prevent an overflow of the watchdog timer. As a result of the software failure, the software cannot execute in the intended sequence, thus the watchdog timer overflows and error is detected. After error is detected, the watchdog timer interrupt (WDIRQ) is generated as non-maskable interrupt (NMI).

Programming of the watchdog timer is generally done in the last step of its programming.

#### ■How to Clear Watchdog Timer

The upper 2 bits of the watchdog timer can be cleared by setting the WDEN flag of the watchdog timer control register (WDCTR) to "0".

The upper 2 bits of the watchdog timer are cleared when the WDEN flag of the watchdog timer control register (WDCTR) is set to "0". Therefore, depending on the clear timing the watchdog timer may be reset at  $1/4 \times$  (watchdog timer frequency). If the WDEN flag is to be repeatedly cleared and set at regular intervals, those operations should be performed within 1/4 of the watchdog timer frequency.

#### ■Watchdog Timer Period

The watchdog timer period is 2<sup>20</sup> x system clock.

If the watchdog timer is not cleared till the set period of watchdog timer, that is regarded as an error and the watchdog interrupt (WDIRQ) of the non-maskable interrupt (NMI) is generated.

Insert the instruction of the watchdog timer clear at even intervals to the main routine. Each intervals should be shorter than the period of the exection time.

If the watchdog timer interrupt service routine does not respond to a watchdog timer interrupt for resetting the chip, the hardware responds to the next one by pulling the RESET pin low to reset the chip.

#### ■Watchdog Timer and CPU Mode

The relation between this watchdog timer and CPU mode features are as follows ;

- (1) In NORMAL, IDLE, SLOW mode, the system clock is counted.
- (2) The counting is continued regardless of switching at NORMAL, IDLE, SLOW mode.
- (3) In HALT mode, the watchdog timer is not stopped.
- (4) In STOP mode, the watchdog timer is cleared automatically by hardware.
- (5) In STOP mode, the watchdog interrupt cannot be generated.
- (6) After releasing reset or recovering from STOP, the counting is executed for the duration of the oscillation stabilization wait time.

On HALT mode, the watchdog timer count won't stop. If it should be stopped, set the WDEN flag of the watchdog timer control register (WDCTR) to "0" to stop the watchdog timer operation, before transition to HALT mode.

When CPU mode is switched to STOP mode during the watchdog timer operation, the operation does not stop after it operates as a counter for oscillation stabilization waiting at recover. If the watchdog timer is not necessary to detect errors, set the WDEN flag of the watchdog timer control register (WDCTR) to "0" to stop the watchdog timer, before CPU mode is switched to STOP mode.

### 8-3-2 Setup Example

The watchdog timer detects errors. The watchdog timer period is set to  $2^{20}$  x system clock. An example setup procedure, with a description of each step is shown below.

#### ■Initial Setup Program (Watchdog Timer Initial Setup Example)

Setup Procedure	Description
<ul> <li>(1) Start the watchdog timer operation.</li> <li>WDCTR (x'03F02')</li> <li>bp0 : WDEN = 1</li> </ul>	<ol> <li>Set the WDEN flag of the WDCTR register to start the watchdog timer operation.</li> </ol>

■Main Routine Program (Watchdog Timer Constant Clear Setup Example)

Setup Procedure		Description	
(1) Set the constant watchdog timer clear. BCLR (WDCTR) WDEN (bp0 · WDEN = 0)		(1)	Clear the watchdog timer under the 1/4 cycle of $2^{18} \times$ system clock.
(bp0 : WDEN = 0) BSET (WDCTR) WDEN (bp0 : WDEN = 1)			The watchdog timer clear should be inserted in the main routine, with the same cycle, and to be the set cycle. Operate the watchdog timer again, after it is stopped (Upper 2 bits of the counter are cleared).

The upper 2 bits of the watchdog timer are cleared when the WDEN flag of the watchdog timer control register (WDCTR) is set to "0". Therefore, depending on the clear timing the watchdog timer may be reset at  $1/4 \times$  (watchdog timer frequency). If the WDEN flag is to be repeatedly cleared and set at regular intervals, those operations should be performed within 1/4 of the watchdog timer frequency.

■Interrupt Service Routine Setup

Setup Procedure	Description
<ul> <li>(1) Set the watchdog interrupt service routine.</li> <li>NMICR (x'03FE1')</li> <li>TBNZ (NMICR) WDIR, WDPRO</li> <li></li> <li></li> <li></li> </ul>	<ul> <li>(1) If the watchdog timer overflows, the non maskable interrupt is generated. Confirm that the WDIR flag of the non maskable interrupt control register (NMICR) is "1" on the interrupt service routine and manage the suitable execution.</li> </ul>

Proper operation, right before the WDOG interrupt is not guaranteed. Therefore, if the WDOG interrupt is generated, initialize the system.

Chapter 9 Buzzer

## 9-1 Overview

This LSI has a buzzer. It can output the square wave having a frequency  $1/2^9$  to  $1/2^{12}$  of the system clock (fs) from P06/BUZZER pin.

### 9-1-1 Block Diagram

Buzzer Block Diagram

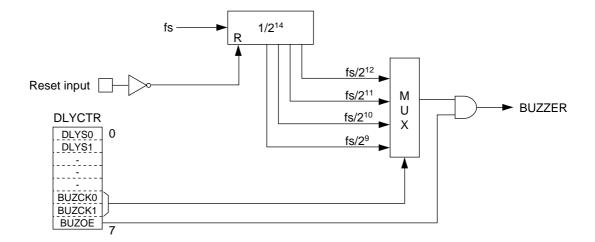

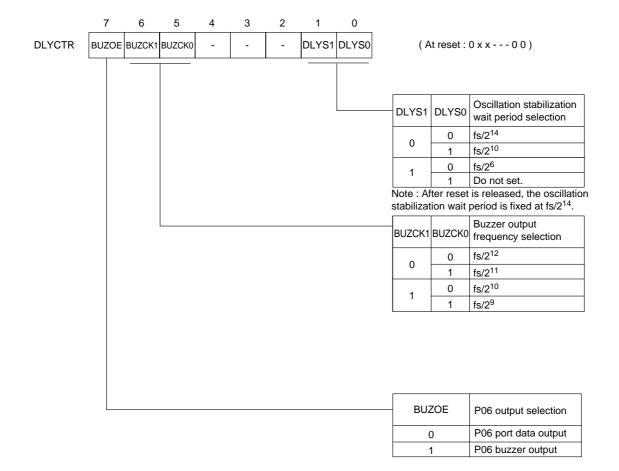

Figure 9-1-1 Block Diagram (Buzzer)

# 9-2 Control Register

■Oscillation Stabilization Wait Time Control Register

#### Figure 9-2-1 Oscillation Stabilization Wait Timer Control Register (DLYCTR : x'03F03', R/W)

# 9-3 Operation

### 9-3-1 Operation

#### ■Buzzer

Buzzer outputs the square wave having a frequency 1/2<sup>9</sup> to 1/2<sup>12</sup> of the system clock (fs). The BUZCK 1, 0 flag of the oscillation stabilization wait control register (DLYCTR) set the frequency of buzzer output. The BUZOE flag of the oscillation stabilization wait control register (DLYCTR) sets buzzer output ON / OFF.

#### ■Buzzer Output Frequency

The frequency of buzzer output is decided by the frequency of the system clock (fs) and the bit 6, 5 (BUZCK1, BUZCK0) of the oscillation stabilization wait control register (DLYCTR). Table 9-3-1 shows the buzzer output frequency.

fosc	fs	BUZCK1	BUZCK0	Buzzer output frequency
20 MHz	10 MHz	0	0	2.44 kHz
		0	1	4.88 kHz
0.00 Mile	4.19 MHz	0	1	2.05 kHz
8.39 MHz		1	0	4.10 kHz
2 MHz	1 MHz	1	1	1.95 kHz

#### Table 9-3-1 Buzzer Output Frequency

### 9-3-2 Setup Example

Buzzer outputs the square wave of 2 kHz from P06 pin. It is used 8.39 MHz as the high oscillation clock (fosc).

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul> <li>(1) Set the buzzer frequency.</li> <li>DLYCTR (x'3F03')</li> <li>bp6-5 : BUZCK1-0 = 01</li> </ul>	<ul> <li>(1) Set the BUZCK1-0 flag of the oscillation stabilization wait control register (DLYCTR) to "01" to select fs/2<sup>11</sup> to the buzzer frequency.</li> <li>When the high oscillation clock fosc is 8.39 MHz, the buzzer output frequency is 2 kHz.</li> </ul>
<ul> <li>(2) Set P06 pin.</li> <li>P0OUT (x'3F10')</li> <li>bp6 : P0OUT6 = 0</li> <li>P0DIR (x'3F30')</li> <li>bp6 : P0DIR6 = 1</li> </ul>	<ul> <li>(2) Set the output data P0OUT6 of P06 pin to "0", and set the direction control P0DIR6 of P06 pin to "1" to select output mode.</li> <li>P06 pin outputs low level.</li> </ul>
<ul> <li>(3) Buzzer output ON.</li> <li>DLYCTR (x'3F03')</li> <li>bp7 : BUZOE = 1</li> </ul>	<ul> <li>(3) Set the BUZOE flag of the oscillation stabilization wait control register (DLYCTR) to "1" to output the square wave of the buzzer output frequency set by P06 pin.</li> </ul>
(4) Buzzer output OFF. DLYCTR (x'3F03') bp7 : BUZOE = 0	<ul><li>(4) Set the BUZOE flag of the oscillation stabilization wait control register (DLYCTR) to "0" to clear, and P06 pin outputs low level.</li></ul>

# Chapter 10 Serial Interface 0

10

# 10-1 Overview

This LSI contains a serial interface 0 that can be used for both communication types of clock synchronous and UART (Half-duplex).

### 10-1-1 Functions

Table 10-1-1 shows functions of serial interface 0.

Communication style	clock synchronous	UART (half-duplex)
Interrupt	SCOIRQ	SCOIRQ
Used pins	SBO0,SBI0,SBT0	TXD,RXD
3 channels type	$\checkmark$	-
2 channels type	$\sqrt{(SBO0,SBT0)}$	$\checkmark$
1 channel type	-	√ (TXD)
Specification of transfer bit count / Frame selection	1 to 8 bits	7 bits + 1 stop 7 bits + 2 stops 8 bits + 1 stop 8 bits + 2 stops
Selection of parity bit	-	$\checkmark$
Parity bit control	-	0 parity 1 parity odd parity even parity
Selection of start condition		no selection Start bit is always added
Specification of the first transfer bit	$\checkmark$	√
Specification of input edge / output edge		-
Internal clock 1/8 dividing		only 1/8 dividing is available
Clock source	fs/2 fs/4 fs/16 Timer 3 output External clock	fs/2 fs/4 fs/16 Timer 3 output
Maximum transfer rate	5.0 MHz	625 kbps

#### Table 10-1-1 Serial Interface 0 Functions

fs : System clock (at NORMAL mode : fs=fosc/2, at SLOW mode : fs=fx/4) When the transmission and reception are operated at the same time at master communication of the clock synchronous, select "no start condition".-

Set fs/2 as maximum frequency for external clock.

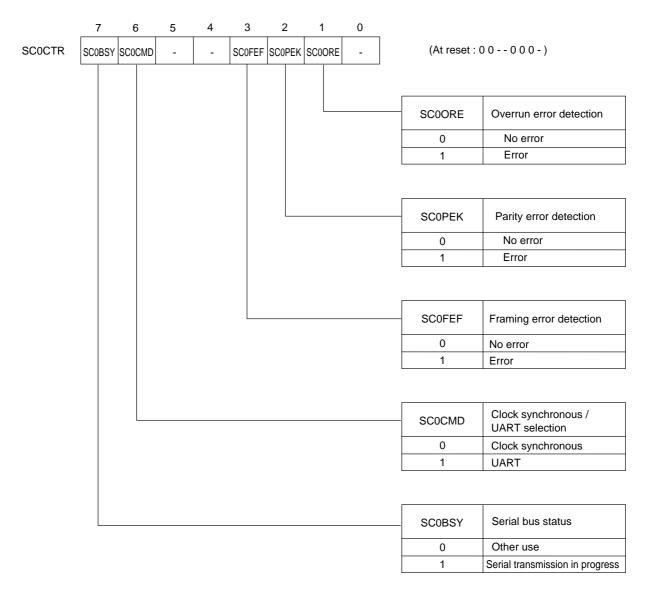

Figure 10-2-7 Serial Interface 0 Control Register (SC0CTR : x'03F54', R/W)

# 10-3 Operation

Serial Interface 0 can be used for both clock synchronous and half-duplex UART.

### 10-3-1 Clock Synchronous Serial Interface

Selection of Clock Synchronous Serial Interface

When the serial interface 0 is used as clock synchronous serial interface, set the SC0CMD flag of the serial interface control register (SC0CTR) to "0".

■Activation Factor for Communication

Table 10-3-1 shows activation factors for communication. At master, the transfer clock is generated by setting data to the transmission / reception shift register SC0TRB, or by receiving a start condition. At slave, input an external clock, or input an external clock after a start condition is input.

Operation mode			Activation factor	Sequence communication
	Enable start condition	Writing data to serial buffer		
Transmission	at master	Disable start condition	Writing data to serial buffer	
Iransmission	Transmission	Enable start condition	Clock reception *	
	at slave	Disable start condition	Clock reception	
		Enable start condition	Start condition reception	
Pagantian	at master	Disable start condition	Writing data to serial buffer	_
Reception		Enable start condition	Start condition reception	
	at slave Disable start condition		Clock reception	

#### Table 10-3-1 Synchronous Serial Interface Activation Factor

\* Start condition is output by writing the transmission data to the transmission / reception shift register SC0TRB when the SC0SBOS flag of the serial interface 0 mode register 3 (SC0MD3) is set to "1". Then, the transmission is started by the slave clock.

When synchronous serial interface is used for master clock reception, it is necessary to write dummy data to the transmission / reception shift register (SC0TRB) for starting master clock. Automatic sequence reception with automatic data transfer can not be used, because it is necessary to write dummy data to serial interface buffer and to read reception data per a frame reception.

Cautions for master cloc	k reception by	y the synchronous serial interface 0
nous serial interface 1,	2 is started b ", then, settin	r serial interface 2, master clock reception by synchro- by setting the SCxSBTS of the serial interface mode g the SCxSBIS to "1" and writing dummy data to the (SCxTRB).
But, by the above setting reception is not started.	g, this serial ir	nterface 0 cannot output the master clock, so that the
Therefore, the following	setup by the s	software is necessary.
<by software=""></by>		
When synchronous seria	e serial interfa	s used for master clock reception, it is necessary to set ace 0 mode register 3 (SC0MD3) to "1", then, set the BOS flag to "1".
•	is output by th	he writing dummy data to the transmission / reception
Program example for ma	aster clock rec	eption by the synchronous serial interface 0
SCOSBTS	← 1	
SC0SBIS, <mark>SC0SBOS</mark> SC0TRB	← 1, 1 ← X'xx'	(dummy data is written, reception is started)
3001110	$\leftarrow$ X X $\rightarrow$	(uuniniy data is written, reception is started)
The SBO0 pin cannot be	used as gene	ral output port by setting the SC0SBOS flag to "1". But
it can be used as genera (P0DIR) to "0".	al input port by	v setting the bp0 of the port 0 direction control register

Serial data communication of serial interface 0 can be available by setting the SC0SBIS flag or the SC0SBOS flag of the SC0MD3 register to "1". The SC0SBIS flag or the SC0SBOS flag should be set to "1" after all conditions are set.

On the master communication of the clock synchronous, set the SC0SBTS flag to "1" before the SC0SBOS flag or the SC0SBIS flag of the SC0MD3 register is set to "1". But, at the slave communication, the SC0SBTS flag needs not to be set to "1".

#### ■Transfer Bit Count

The transfer bit count is selected from 1 bit to 8 bits. Set it by the SC0LNG2 to 0 flag of the SC0MD0 register (at reset : 000).

The SC0LNG2 to 0 flags change at the opposite edge of the transmission data output edge.

After the transfer has completed, the transfer bit count in the SC0LNG2 to 0 flags of the SC0MD0 register is changed. Except in an 8-bit transfer, reset the transfer bit count at the time of the next transmission.

When the SC0SBOS flag or the SC0SBIS flag of the SC0MD3 register to "1" and the SC0CE1 to 0 flags of the SC0MD0 register are changed, the transfer bit count in the SC0LNG2 to 0 flags of the SC0MD0 register may be incremented.

#### ■Start Condition

The SC0STE flag of the SC0MD0 register sets if a start condition is enabled or not. If a start condition is enabled and input, a bit counter is cleared to start the communication. The start condition, if the SC0CE1 flag of the SC0MD0 register is set to "0", is regarded when a data line (SBI0 pin (with 3 channels) or SB00 pin (with 2 channels) is changed from "H" to "L" as a clock line (SBT0 pin) is "H". Also, the start condition, if the SC0CE1 flag is set to "1", is regarded when a data line (SBI0 pin (with 3 channels) or SB00 pin (with 2 channels) is changed from "H" to "L" as a clock line (SBI0 pin (with 3 channels) or SB00 pin (with 2 channels) is changed from "H" to "L" as a clock line (SBI0 pin (with 3 channels) or SB00 pin (with 2 channels) is changed from "H" to "L" as a clock line (SBI0 pin (with 3 channels) or SB00 pin (with 2 channels) is changed from "H" to "L" as a clock line (SBI0 pin (with 3 channels) or SB00 pin (with 2 channels) is changed from "H" to "L" as a clock line (SBI0 pin (with 3 channels) or SB00 pin (with 2 channels) is changed from "H" to "L" as a clock line (SBI0 pin (with 3 channels) or SB00 pin (with 2 channels) is changed from "H" to "L" as a clock line (SBT0 pin) is "L".

When the reception and the transmission should be operated at the same time, disable start condition for proper operation.

Enabling the start condition drives the SBO0 pin high level for a fixed time interval (1/2 the clock source cycle) after the transmission has completed. If the start condition is disabled, the SBO0 pin will remain at the level of the last data bit.

If the start condition is enabled, the SC0LNG2 to 0 flags of the SC0MD0 register will be cleared when the start condition is received. In this case, the receive bit count is fixed at 8 bits.

On the master communication of the clock synchronous, if start condition is enabled, the reception and the transmission should not be operated at the same time. The clock may be continued to output after the communication has completed.

#### ■First Transfer Bit

The SC0DIR flag of the SC0MD0 register can set the first transfer bit. MSB first or LSB first can be selected.

#### Transmission Data

Set the transmission data to the transmission / reception shift register (SC0TRB).

When switching from transmission to reception, set the SC0SBOS flag of the SC0MD0 register to "0" and then set the SC0SBIS flag to "1". Do not change both of these flags at the same time.

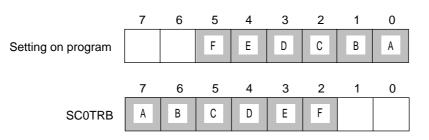

When switching from reception to transmission, set the SC0SBIS flag of the SC0MD0 register to "0" and then set the SC0SBOS flag to "1". Do not change both of these flags at the same time.

#### ■Tranfer Bit Count and First Transfer Bit

On transmission, when the transfer bit is 1 bit to 7 bits, the data storing method to the transmission / reception shift register SC0TRB is different, depending on the first transfer bit selection. At MSB first, use the upper bits of SC0TRB. When there are 6 bits to be transferred, as shown on figure 10-3-1-1, if data "A" to "F" are stored to bp2 to bp7 of SC0TRB, the transmission is started from "F" to "A". At LSB first, use the lower bits on the program. When there are 6 bits to be transferred, as shown on figure 10-3-1-2, if data "A" to "F" are stored to bp0 to bp5 on the program, the transmission is started from "A" to "F", because their order is changed in the SWAP circuit.

#### ■Received Data Buffer

The received data buffer SCORXB is the sub-buffer that pushed the received data in the internal shift register. After the communication complete interrupt SCOIRQ is generated, data stored in the transmission / reception shift register is stored to the received data buffer SCORXB automatically. SCORXB can store data up to 1 byte. SCORXB is rewritten in every communication complete, so read data of SCORXB till the next receive complete. And before the next data reception is started, the same data to the SCORXB can be read, even if the SCOTRB is reading.

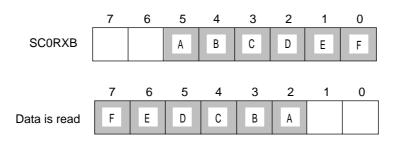

When the SC0SBIS flag of the SC0MD3 register is set to "serial interface input", the SC0TRI flag of the SC0MD1 register is set to "1" at the same time SC0IRQ is generated. SC0TRI is cleared to "0" when the next reception has completed.

#### ■Receive Bit Count and First Transfer Bit

On reception, when the transfer bit count is 1 bit to 7 bits, the data reading method from the received data buffer SCORXB is different depending on the first transfer bit selection. At MSB first, data are read from the lower bits of SCORXB. When there are 6 bits to be transferred, as shown on figure 10-3-2-1, if data "F" to "A" are stored to bp0 to bp5 of SCORXB. Also, data are read as the same way. At LSB first, data are read from the upper bits of SCORXB. When there are 6 bits to be transferred, as shown on figure 10-3-2-2, if data "A" to "F" are stored to bp0 to bp5 of SCORXB. But their order is changed in the SWAP circuit, and reading is started from the upper bits.

Figure 10-3-2-1 Receive Bit Count and Transfer First Bit (starting with MSB bit)

■Input Edge / Output Edge Setup

The SC0CE1 to 0 flag of the SC0MD0 register set an output edge of the transmission data, an input edge of the reception data. As the SC0CE1 flag = "0", the transmission data is output at the falling edge, and as "1", output at the rising edge. As SC0CE0="0", the reception data is stored at the inversion edge to the output edge of transmission data, and as "1", stored at the same edge.

Table 10-3-2 Input Edge and Output Edge of Transmission Reception Data

SC0CE0	SC0CE1	Reception data input edge	Transmission data output edge
0	0		
0	1	Y	
1	0		
1	1		

#### ■Clock Setup

The clock source can be selected from the internal clock or the external clock. Here is the internal clock source that can be set by the SC0CK1 to 0 register of the SC0MD1 register. Also, the internal clock can be divided by 8, by setting the SC0CKM flag of the SC0MD1 register to "1".

	Serial interface 0
Clock source (internal clock)	fs/2
	fs/4
	fs/16
	Timer 3 output

#### Table 10-3-3 Synchronous Serial Interface Internal Clock Source

#### ■Data Input Pin Setup

3 channels type (clock pin (SBT0 pin), data output pin (SB00 pin), data input pin (SBI0 pin)) or 2 channels type (clock pin (SBT0 pin), data I/O pin (SBO0 pin)) can be selected as the communication. SBI0 pin can be used for only serial data input. SBO0 pin can be used for serial data input or output. The SC0IOM flag of the SC0MD3 register can select if the serial data is input from SBI0 pin or SBO0 pin. When "data input from SBO0 pin" is selected to set the 2 channels type, the P0DIR0 flag of the P0DIR register controls direction of SBO0 pin to switch transmission / reception. At that time, SBI0 pin is free to be used as a general port.

At reception, if SC0IOM of the SC0MD3 register is set to "1" and "serial data input from SB00" is selected, SBI0 pin is used as a general port.

#### ■BUSY Flag

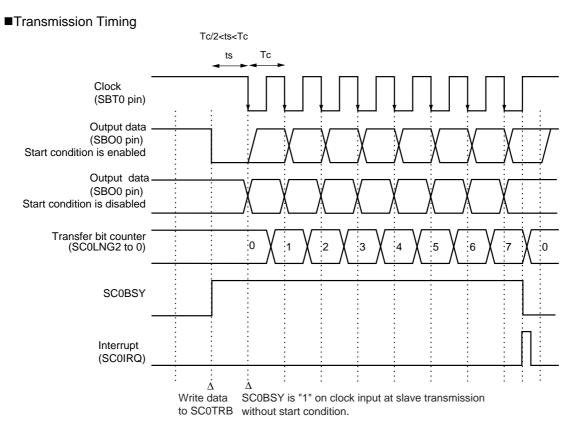

When the activation factor is generated, shown in table 10-3-1, and the serial interface communication is started, the BUSY flag SC0BSY of the SC0CTR register is set to "1". That is cleared to "0" when the communication complete interrupt SC0IRQ is generated.

#### ■Other Control Flag Setup

Table 10-3-4 shows flags that are not used at clock synchronous communication. So, they need not to be set or monitored.

Register	Flag	Detail	
SC0MD1	SCOBRKF	Brake status reception monitor	
SCONDT	SC0ERE	Error monitor	
	SCONPE	Parity is enabled	
SC0MD2	SC0PM1 to 0	Added bit specification	
SC0IVID2	SC0FM1 to 0	Frame mode specification	
	SC0BRKE	Brake status transmission control	
	SCOORE	Overrun error detection	
SC0CTR	SCOPEK	Parity error detection	
	SC0FEF	Frame error detection	

#### Table 10-3-4 Other Control Flag

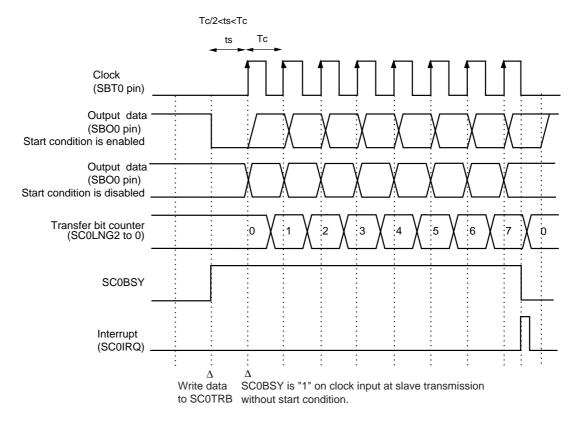

Figure 10-3-4 Transmission Timing (rising edge)

#### ■Reception Timing

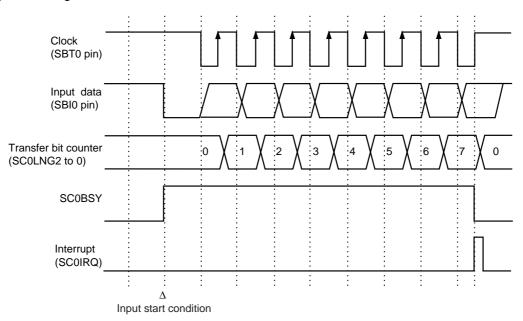

Figure 10-3-5 Reception Timing (rising edge, start condition is enabled)

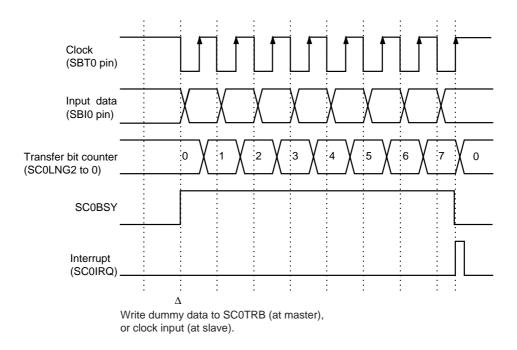

Figure 10-3-6 Reception Timing (rising edge, start condition is disabled)

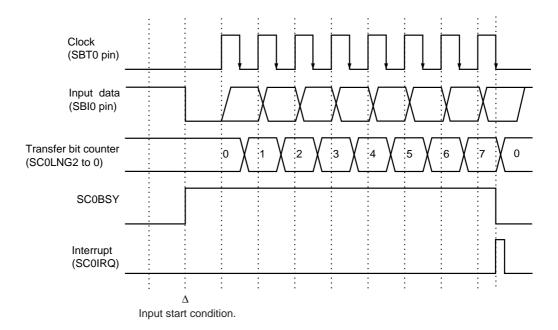

Figure 10-3-7 Reception Timing (falling edge, start condition is enabled)

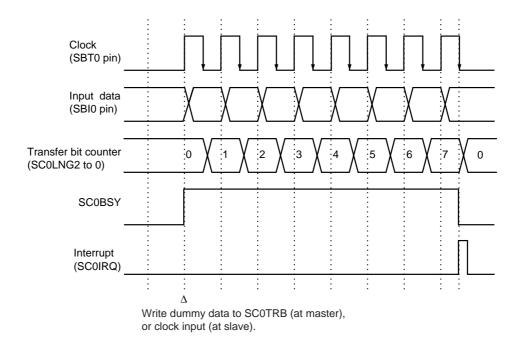

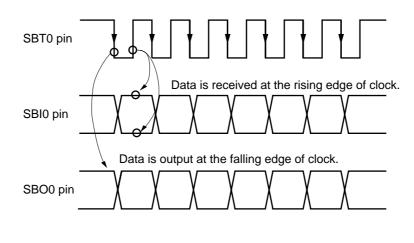

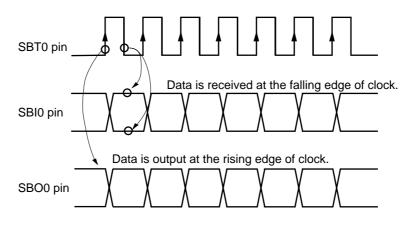

Figure 10-3-8 Reception Timing (falling edge, start condition is disabled)

#### Transmission / Reception Simultaneous Timing

When transmission and reception are operated at the same time, set the SC0CE0 to 1 flag of the SC0MD0 register to "00" or "01". Data is received at the opposite edge of the transmission clock, so that the reception clock should be the opposite edge of the transmission clock from the other side.

#### ■Pins Setup (3 channels, at transmission)

Table 10-3-5 shows the setup for synchronous serial interface pin with 3 channels (SBO0 pin, SBI0 pin, SBT0 pin) at transmission.

	Data output pin	Data input pin	Clock	/O pin

### 10-3-2 Setup Example

#### Transmission / Reception Setup Example

The setup example for clock synchronous serial interface communication with serial interface 0 is shown. Table 10-3-10 shows the conditions at transmission / reception.

 Table 10-3-10
 Setup Examples for Synchronous Serial Interface Transmission / Reception

Setup item	set to	Setup item	set to
SBI0 / SBO0 pin	Independent (with 3 channels)	Clock source	fs/2
Transfer bit count	8 bits	Clock source 1/8 dividing	not divided by 8
Start condition	none	SBT0 / SBO0 pin style	Nch open-drain
First transfer bit	MSB	SBT0 pin pull-up resistor	Not added
Innut algoly adap	falling edge	SBO0 pin pull-up resistor	Not added
Input clock edge		SBI0 pin pull-up resistor	Added
Output clock edge	rising edge	Serial 0 communication complete interrupt	Enable
Clock	Internal clock (master communication)		

An example setup procedure, with a description of each step is shown below.

Setup Procedure				Description	
(1)	Select the c interface. SC0CTR bp6	lock synchronous s (x'3F54') :SC0CMD	serial = 0	(1)	Set the SC0CMD flag of the serial interface 0 control register (SC0CTR) to "0" to select the clock synchronous serial interface.
(2)		MD0 register. ransfer bit count (x'3F50') : SC0LNG2-0	= 000	(2)	Set the SC0LNG2-0 flag of the serial interface 0 mode register 0 (SC0MD0) to "000" to set the transfer bit to 8 bits.
	Select the s SC0MD0 bp3	tart condition. (x'3F50') : SC0STE	= 0		Set the SC0STE flag of the SC0MD0 register to "0" to disable start condition.
	Select the fi SC0MD0 bp4	rst bit to be transfe (x'3F50') : SC0DIR	erred. = 0		Set the SC0DIR flag of the SC0MD0 register to "0" to set MSB as a transfer first bit.
	Select the tr SC0MD0 bp6 bp5	ransfer edge. (x'3F50') : SC0CE0 : SC0CE1	= 0 = 1		Set the SC0CE0, 1 flag of the SC0MD0 register to "0, 1" to set the transmission data output edge "rising" and the received data input edge "falling".

	Setu	p Procedure			Description
(3)	Select the cl SC0MD1 ( bp4-3 bp5		= 00 = 0	(3)	Set the SC0CK1-0 flag of the SC0MD1 register to "00" to select the clock source "fs/2". Set the SC0CKM flag to "0" to select not to divide the clock source by 1/8.
(4)	Select the tra SC0MD3 ( bp0		= 1	(4)	Set the SC0SBTS flag of the SC0MD3 register to "1" to set the SBT0 pin to serial interface clock I/O pin. The communication is used with the internal clock (master communication).
(5)	Control the p SC0MD3 ( bp4-3 bp5 P0PLU (x'3 bp2-0	x'3F53') : SC0SBOM, So : SC0IOM	COSBTM = 11 = 0 = 010	(5)	Set the SC0SBOM, SC0SBTM flag of the SC0MD3 register to "11" to select the SBO0/ SBT0 pin to "N-ch open drain". Set the SC0IOM flag to "0" to set "input serial data from the SBI0 pin". Set the POPLU2-0 flag of the POPLU register to "010" to select "add pull-up resistor only to the SBI0 pin.
(6)	Control the p P0DIR (x'3 bp2-0		= 101	(6)	Set the P0DIR2-0 flag of the port 0 pin direction control register (P0DIR) to "101" to set P00 and P02 to output mode and to set P01 to input mode.
(7)	Control the p SC0MD3 ( bp2 bp1		= 1 = 1	(7)	Set the SC0SBOS, SC0SBIS flag of the SC0MD3 register to "1" to set SBO0 pin "serial data output", SBI0 pin "serial data input".
(8)	Set the intern SC0ICR (x bp7-6		= 10	(8)	Set the interrupt level by the SC0LV1-0 flag of the serial interface 0 interrupt control register (SC0ICR).
(9)	Enable the ir SC0ICR (x bp1		= 1	(9)	Set the SCOIE flag of the SCOICR register to "1" to enable interrupts. If the interrupt request flag (SCOIR of the SCOICR register) had already been set, clear SCOIR before an interrupt is enabled. [ C>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Setup Procedure	Description
(10) Start serial interface transmission. Transmission data→SC0TRB (x'3F55') Reception data→input to SBI0 pin.	<ul> <li>(10) Set the transmission data to the serial interface 0 transmission / reception shift register (SC0TRB). Then, an internal clock is generated to start transmission / reception. After the transmission has finished, serial interface 0 interrupt SC0IRQ is generated.</li> </ul>

Note : In (2), each settings can be set at once.

When only reception with 3 channels is operated, set SC0SBOS of the SC0MD3 register to "0" and select a port. The SBO0 pin can be used as a general port.

When SBO0 / SBI0 pin are connected for communication with 2 lines, the SBO0 pin inputs / outputs serial data. The port direction control register P0DIR switches input / output. At reception, set SC0SBIS of the SC0MD3 register to "1", always, to select "serial data input". The SBI0 pin can be used as a general port.

If the SC0IOM flag of the SC0MD3 register is set to "1", the SBI0 pin can be used as port. When the SBO0 pin is input mode, reception is operated, and when it is output mode, transmission is operated.

When the register except the SC0TRB is written or rewritten, set the SC0SBOS, SC0SBIS flag to "0".

When the internal clock is used as clock source, write dummy data to the SC0TRB register after setting the SC0SBIS flag and the SC0SBOS flag of the SC0MD3 register to "1". Even if the reception is operated again, write dummy data to the SC0TRB register.

# 10-3-3 Half-duplex UART Serial Interface

Serial interface 0 can be used for half-duplex UART communication. Table 10-3-11 shows UART serial interface functions.

Communication style	UART(Half-duplex)
Communication style	OART (Trail-duplex)
Interrupt	SC0IRQ(transmission, reception)
Used pins	TXD(output, input) RXD(input)
First transfer bit	MSB/LSB
Parity bit selection	$\checkmark$
Parity bit control	0 parity 1 parity odd parity even parity
Frame selection	7 bits + 1 stop 7 bits + 2 stops 8 bits + 1 stop 8 bits + 2 stops
Maximum transfer rate	625 kbps

#### Table 10-3-11 UART Serial Interface Functions

#### ■Selection of Half-duplex UART Serial Interface

When the serial interface 0 is used as half-duplex UART serial interface, set the SC0CMD flag of the serial interface 0 control register (SC0CTR) to "1".

#### ■Activation Factor for Communication

At transmission, if any data is written to the transmission / reception shift register SC0TRB, a start bit (Data is changed from "H" to "L") is generated to start transfer. At reception, if a start bit (Data is changed from "H" to "L") is received, communication is started. At reception, if the data length of "L" is longer than 0.5 bit, that can be regarded as a start bit.

#### Transmission

Data transfer is automatically started by writing data to the transmission / reception shift register SC0TRB after setting the SC0SBOS flag of the SC0MD3 register to "1". During transmission, reception and start bit input are disabled.

#### ■Reception

When the SC0SBIS flag of the SC0MD3 register is set to "1" and a start bit is received, reception is started after the transfer bit counter is set as frame mode is specified. During reception, transmission is disabled.

#### ■Transfer Bit Count Setup

The transfer bit count is automatically set after the frame mode is specified by the SC0FM1 to 0 flag of the SC0MD2 register. If the SC0CMD flag of the SC0CTR register is set to "1", and UART communication is selected, the synchronous serial data transfer bit count selection flag SC0LNG2 to 0 of the SC0MD0 register is automatically set.

#### ■Input Edge / Output Edge Setup

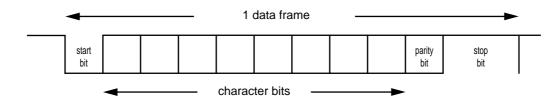

The SC0CE 1 to 0 flag of the SC0MD0 register set an output edge of the transmission data, an input edge of the received data. At UART communication, the transfer clock is not necessary, but the SC0CE1-0 flag should be set to decide the timing of the data transmission / reception in this serial interface. At UART communication, generally, set the SC0CE1-0 flag to "00", the transmission data output edge to "falling", and the reception data input edge to "rising". Refer to table 10-3-2 (X-16) for Input Edge / Output Edge Setup detail.

#### ■Data Input Pin Setup

The communication mode can be selected from with 2 channels (data output pin (TXD pin), data input pin (RXD pin)), or with 1 channel (data I/O pin TXD pin). The RXD pin can be used only for serial data input. The TXD pin can be used for serial data input or output. The SCOIOM flag of the SCOMD3 register can specify which pin, RXD or TXD to input the serial data. "Data input from TXD pin" is selected to be with 1 channel communication. At switching transmission / reception, TXD pin's direction should be controlled by the P0DIR0 flag of the P0DIR register. At that time, the RXD pin is not used, so that it can be used as a general port.

#### ■Frame Mode and Parity Check Setup

Figure 10-3-11 shows the data format at UART communication.

#### Figure 10-3-11 UART Serial Interface Transmission / Reception Data Format

The transmission / reception data consists of start bit, character bit, parity bit and stop bit. Table 10-3-12 shows its kinds to be set.

Table 10-3-12 UART Serial Interface Transmission / Reception Data	Table 10-3-12	UART Serial Interface Tr	ransmission /	<b>Reception Data</b>
---	---------------	--------------------------	---------------	-----------------------

Start bit	1 bit ( must be 'L')
Character bit	7, 8 bits
Parity bit	fixed to 0, fixed to 1, even, odd, none
Stop bit	1, 2 bits (noramally 'H')

The SC0FM1 to 0 flag of the SC0MD2 register sets the frame mode. Table 10-3-13 is shown the UART serial interface frame mode setting. If the SC0CMD flag of the SC0CTR register is set to "1", and UART communication is selected, the SC0LNG2 to 0 flag of the SC0MD0 register is automatically set.

Table 10-3-13 UART Serial Interface Frame Mode	Table 10-3-13	UART Serial Interf	ace Frame Mode
--	---------------	--------------------	----------------

SC0MD2	2 register	Frame mode	
SC0FM1	SC0FM0		
0	0	Character bit 7 bits + Stop bit 1 bit	
0	1	Character bit 7 bits + Stop bit 2 bits	
1	0	Character bit 8 bits + Stop bit 1 bit	
1	1	Character bit 8 bits + Stop bit 2 bits	

Parity bit is to detect wrong bits with transmission / reception data.

Table 10-3-14 shows kinds of parity bit. The SCONPE, SCOPM1 to 0 flag of the SCOMD2 register set parity bit.

sc	0MD2 regis	ster	Dority bit	Satura
SCONPE	SC0PM1	SC0PM0	Parity bit	Setup
0	0	0	fixed to 0	Set parity bit to "0".
0	0	1	fixed to 1	Set parity bit to "1".
0	1	0	odd parity	Control the total number of "1" of parity bit and character bit should be odd.
0	1	1	even parity	Control the total number of "1" of parity bit and character bit should be even.
1	-	-	none	Do not add parity bit.

Table 10-3-14 Parity Bit of UART Serial Interface

#### Break Status Transmission Control Setup

The SC0BRKE flag of the SC0MD2 register generates the break status. If SC0BRKE is set to "1" to select the break transmission, all bits from start bits to stop bits transfer "0".

#### ■Reception Error

At reception , there are 3 types of error ; overrun error, parity error and framing error. Reception error can be determined by the SCOORE, SCOPEK and SCOFEF flag of the SCOCTR register. Even one of those errors is detected, the SCOERE flag of the SCOMD1 register is set to "1". The reception error flag is renewed at generation of the reception complete interrupt SCOIRQ. The judgement of the received error flag should be operated until the next communication has finished. The communication operation does not have any effect on those error flags. Table 10-3-15 shows the list of reception error source.

Table 10-3-15 Reception Error Source of UART Serial Interface

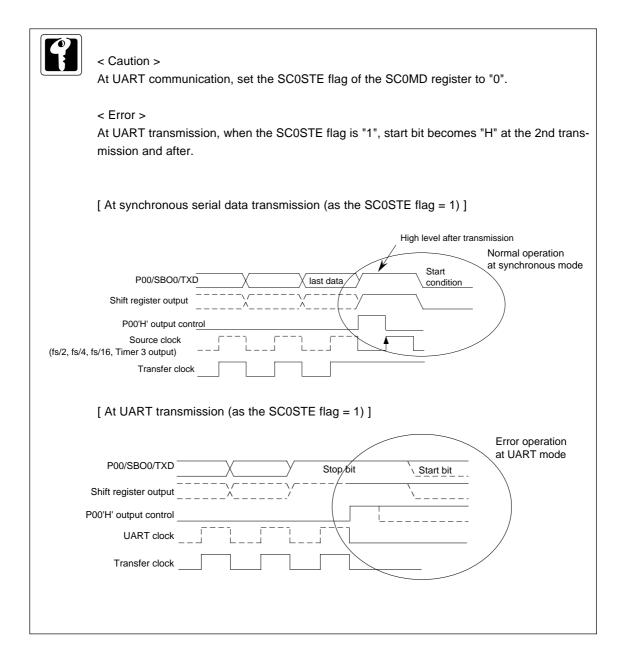

Flag	Error	Error source		
SC0ORE	Overrun error	Next data is received before reading the receive buffer.		
		at fixed to 0	when parity bit is "1"	
SCOPEK	Parity error	at fixed to 1	when parity bit is "0"	
		odd parity	The total of "1" of parity bit and character bit is even.	
		even parity	The total of "1" of parity bit and character bit is odd.	
SC0FEF	Framing error	Stop bit ('H') is not detected.		

#### ■Judgement of Break Status Reception

Reception at break status can be judged. If all received data from start bit to stop bit is "0", the SC0BRKF flag of the SC0MD1 register is set and regard the break status. The SC0BRKF flag is set at generation of the reception complete interrupt SC0IRQ.

#### ■Selection of Start Condition

The SC0STE flag of the SC0MD0 register is originally to select start condition of the synchronous serial data communication. When serial interface 0 is used as half-duplex UART serial interface, set the SC0STE flag always to "0" to prevent the following errors.

#### ■Other Control Flags

The following flags need not to be set at UART communication.

Register	Flag	Detail
SC0MD0	SC0LNG2 to 0	Selection ot the transfer bit count (automatically set)
SC0MD1	SCOCKM	Selection of the 1/8 division (automatically set)
SC0MD3	SCOSBTS	Selection of the SBT pin's function
	SC0SBTM	Selection of the SBT pin's style

#### Table 10-3-16Other Control Flags

The following items are the same to clock synchronous serial interface. Reference as follows ;

■First Transfer Bit Setup Refer to : X-13

■Transfer Bit Count and First Transfer Bit Refer to : X-15

■Received Data Buffer Refer to : X-15

■Receive Bit Count and First Transfer Bit Refer to : X-15

■BUSY Flag Operation Refer to : X-18

#### ■Transmission Timing

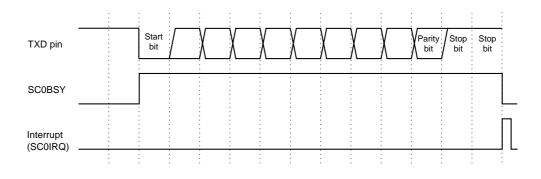

Figure 10-3-12 Transmission Timing (parity bit is enabled)

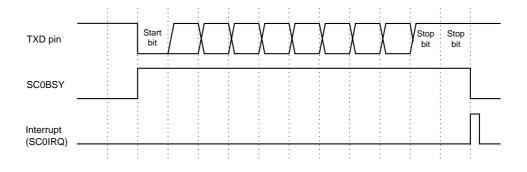

Figure 10-3-13 Transmission Timing (parity bit is disabled)

#### ■Reception Timing

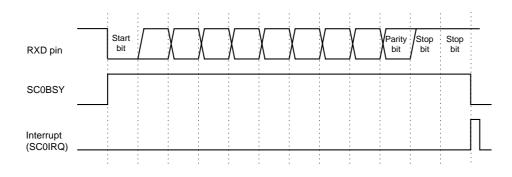

Figure 10-3-14 Reception Timing (parity bit is enabled)

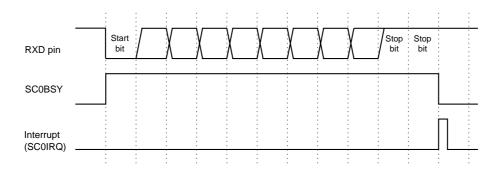

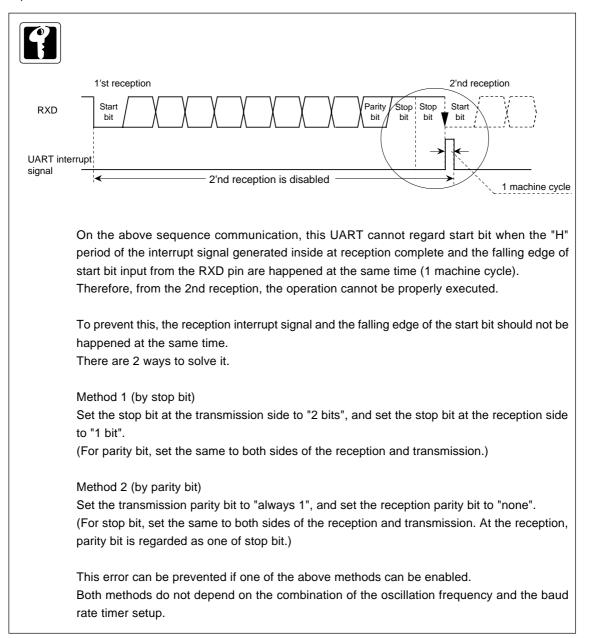

Figure 10-3-15 Reception Timing (parity bit is disabled)

#### ■Sequence Communication

#### ■Transfer Rate

Baud rate timer (timer 3) can set any transfer rate.

Table 10-3-17 shows the setup example of the transfer rate. For detail of the baud rate timer setup, refer to chapter 5. 5-8 serial interface transfer clock output operation.

Table 10-3-17	UART Serial Interface Transfer Rate Setup Register
---------------	--

Setup	Register	Page
Serial 0 clock source (timer 3 output)	SC0MD1	X - 7
Timer 3 clock source	TM3MD	V - 12
Timer 3 compare register	TM3OC	V - 7

Timer 3 compare register is set as follows ;

overflow cycle = (set value of compare register + 1) x timer clock cycle

baud rate = 1 / (overflow cycle x 2 x 8) ("8" means that clock source is divided by 8) Therefore,

set value of compare register = timer clock frequency / (baud rate x 2 x 8) - 1

For example, if baud rate should be 300 bps at timer 3 clock source fs/4 (fosc = 8 MHz, fs = fosc/2), set value should be as follows ;

Set value of compare register =  $(8 \times 10^6 / 2 / 4) / (300 \times 2 \times 8) - 1$ = 207 = x'CF'

Timer 3 clock source and the set values of timer 3 compare register at the standard transfer rate are shown on the following page.

At UART communication, "clock source is divided by 8" is selected, regardless of the setup for the SC0CKM flag of the SC0MD1 register.

			Transfer Rate (bps)										
fosc	Clock source	30	00	1	200	24	100	48	300	96	600	19	9200
(MHz)	(timer 3)	Set value	Calculated Value	Set value	Calculated Value	Set value	Calculated Value	Set value	Calculated Value	Set value	Calculated Value	Set value	Calculated Value
4.00	fosc	-	-	207	1202	103	2403	51	4807	25	9615	12	19230
	fs/4	103	300	-	-	-	-	-	-	-	-	-	-
	fs/16	-	-	-	-	-	-	-	-	-	-	-	-
4.19	fosc	-	-	217	1201	108	2402	54	4762	26	9699	-	-

### Table 10-3-18 UART Serial Interface Transfer Rate and Timer 3 Compare Register (decimal)

#### ■Pin Setup (1, 2 channels, at transmission)

Table 10-3-19 shows the pins setup at UART serial interface transmission. The pins setup is common to the TXD pin, RXD pin, regardless of those pins are independent / connected. The RXD pin can be used as general port (P01).

 Table 10-3-19
 UART Serial Interface Pin Setup (1, 2 channels, at transmission)

Sotup itom	Data output pin	Data input pin			
Setup item	TXD pin	RXD pin			
Pin	P00	P01			
	TXD / RXD pins connec	ted or independe			
TXD / RXD pins	SC0MD3(SC0IOM)				
Function	Serial data output	"1" input			
Function	SC0MD3(SC0SBOS)	SC0MD3(SC0SBIS)			
Style	Push-pull / Nch open-drain	-			
	SC0MD3(SC0SBOM)				
	Output mode				
VO	P0DIR(P0DIR0)				
Dulum	Added / Not added				
Pul-up	P0PLU(P0PLU0)	-			

■Pin Setup (2 channels, at reception)

Table 10-3-20 shows the pins setup at UART serial interface reception with 2 channels (TXD pin, RXD pin). The TXD pin can be used as general port (P00).

 Table 10-3-20
 UART Serial Interface Pin Setup (2 channels, at reception)

Data output pin	Data input pin		
TXD pin	RXD pin		
P00	P01		
TXD / RXD pins	s independent		
SC0MD3(	SC0IOM)		
port	serial data input		
SC0MD3(SC0SBOS)	SC0MD3(SC0SBIS)

-	P0DIR(P0DIR1)		
	added / not added		
-	P0PLU(P0PLU1)		
	TXD pin P00 TXD / RXD pins SC0MD3( port		

■Pin Setup (1 channel, at reception)

Table 10-3-21 shows the pin setup at UART serial interface reception with 1 channel (TXD pin). The RXD pin can be used as general port (P01).

Cotum itom	Data output pin	Serial unused pin	
Setup item	TXD pin	RXD pin	
Pin	P00	P01	
	TXD / RXD pir	ns connected	
TXD / RXD pin	SC0MD3(	SC0IOM)	
Function	Port	Serial data input	
Function	SC0MD3(SC0SBOS)	SC0MD3(SC0SBIS)	
Style	-	-	
1/0	Input mode	-	
VO	P0DIR(P0DIR0)	-	
Dullup	added / not added		
Pull-up	P0PLU(P0PLU0)	-	

 Table 10-3-21
 UART Serial Interface Pin Setup (1 channel, at reception)

## 10-3-4 Setup Example

#### ■Transmission Setup

The setup example at UART transmission with serial interface 0 is shown. Table 10-3-22 shows the conditions at transmission.

Setup item	set to
TXD / RXD pin	connected (with 1 channel)
Frame mode specification	8 bits + 2 stop bits
First transfer bit	MSB
Clock source	timer 3 output
TXD pin type	Nch open-drain
Pull-up resistor of TXD pin	not added
Parity bit add / check	"0"add / check
Serial interface 0 interrupt	Enable.

Table 10-3-22 UART Interface Transmission Setup

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul> <li>(1) Select the UART communication.</li> <li>SC0CTR (x'3F54')</li> <li>bp6 : SC0CMD = 1</li> </ul>	<ul><li>(1) Set the SC0CMD flag of the SC0CTR register to "1" to select the UART communication.</li></ul>
<ul> <li>(2) Select the first bit to be transferred.</li> <li>SC0MD0 (x'3F50')</li> <li>bp4 : SC0DIR = 0</li> </ul>	(2) Select MSB as first transfer bit by the SC0DIR flag of the SC0MD0 register.
<ul> <li>(3) Select the start condition.</li> <li>SC0MD0 (x'3F50')</li> <li>bp3 : SC0STE = 0</li> </ul>	<ul> <li>(3) Set the SC0STE flag of the SC0MD0 register to disable start condition.</li> <li>[ C→ X-33 ■Selection of Start Condition ]</li> </ul>
<ul><li>(4) Select the clock source.</li><li>SC0MD1 (x'3F51')</li><li>bp4-3 : SC0CK1-0 = 11</li></ul>	(4) Set the SC0CK1-0 flag to select timer 3 output as a clock source.
(5) Select the parity bit. SC0MD2 (x'3F52') bp0 : SC0NPE = 0 bp2-1 : SC0PM1-0 = 00	<ul><li>(5) Set the SC0NPE flag of the SC0MD2 register to select "parity is enabled", and set the SC0PM1-0 flag to select "0 added".</li></ul>

	Setup Procedure			Description
(6)	Specify the flame mode. SC0MD2 (x'3F52') bp4-3 : SC0FM1-0	= 11	(6)	Set the SC0FM1-0 flag of the SC0MD2 register to "11" to select 8 bits data + 2 stop bits at the frame mode.
(7)	Control the output data. SC0MD2 (x'3F52') bp5 : SC0BRKE	= 0	(7)	Set the SC0BRKE flag of the SC0MD2 register to "0" to select serial data transmission.
(8)	Control the pin type. SC0MD3 (x'3F53') bp4 : SC0SBOM P0PLU (x'3F40') bp0 : P0PLU0	= 1 = 0	(8)	Set the SC0SBOM flag of the SC0MD3 register to "1" to select N-ch open drain for the TXD pin. Set the P0PLU0 flag of the P0PLU register to "0" not to add pull-up resistor.
(9)	Select the reception mode SC0MD3 (x'3F53') bp5 : SC0IOM	e. = 1	(9)	Set the SC0IOM flag of the SC0MD3 register to "1" to set the SBO0 to transmission / reception port.
(10)	Control the pin direction. P0DIR (x'3F30') bp0 : P0DIR0	= 1	(10)	Set the P0DIR0 flag of the P0DIR register to "1" to set P00 to output mode.
(11)	Select the interrupt level. SC0ICR (x'03FE8') bp7-6 : SC0LV1-0	= 10	(11)	Select the interrupt level by the SC0LV1-0 flag of the serial interface 0 interrupt control register (SC0ICR).
(12)	Enable the interrupt. SC0ICR (x'3FE8') bp1 : SC0IE	= 1	(12)	Set the SCOIE flag of the SCOICR register to "1" to enable the interrupt request. If any interrupt request flag had already been set, clear it. [ C Chapter 3. 3-1-4 Interrupt Flag Setup ]
(13)	Set the baud rate timer.		(13)	Set the baud rate timer by the TM3MD register, TM3OC register. And set the TM3EN flag to "1" to operate timer 3. [CP Chapter 5. 5-8 Serial interface transfer clock output ]
(14)	Set the serial interface cor SC0MD3 (x'3F53') bp2 : SC0SBOS	mmunication. = 1	(14)	Set the SC0SBOS flag of the SC0MD3 register to "1" to set the serial interface communication.
(15)	Start the serial interface communication. SC0TRB (x'3F55')		(15)	Set the transfer data to the SC0TRB register. And the serial interface communication is started.

Only timer 3 can be used as a baud rate timer. For baud rate setup, refer to Chapter 5. 5-8 Serial Interface Transfer Clock Output.

Serial interface 0 is operated by setting the SC0SBOS flag or the SC0SBIS flag of the SC0MD3 register to "1".

The SC0SBOS flag or the SC0SBIS flag should be set after all conditions are set. After that, at transmission, the communication is started by writing data to the SC0TRB.

When a register except the SC0TRB is written / rewritten, set the SC0SBOS, the SC0SBIS flag to "0", in advance.

When the TXD / RXD pin are connected for communication with 1 channel, the TXD pin inputs / outputs serial data. The port direction control register P0DIR should be set, for switching input / output. The RXD pin can be used as a general port.

When the serial interface port is enabled, if the SC0CE1-0 flag of the SC0MD0 register is switched, the transfer bit count may be changed. If it is used as half-duplex UART serial interface, setting the SC0CE1-0 flag fixed to "00" is recommended.

After transmission has completed, the TXD pin is "H" level.

If the frame mode is set by the SC0FM flag of the SC0MD2 register, the SC0LNG2-0 flag of the SC0MD0 register is automatically set.

After the transfer has completed, the transfer bit count in the SC0LNG2-0 flag of the SC0MD0 register is automatically set.

At UART transmission, set the SC0SBOS flag of the SC0MD3 register to "1", and set the SC0SBIS flag to "0". Setting both of flags to "1" is disabled.

#### ■Reception Setup

The setup example at UART reception with serial interface 0 is shown.

Table 10-3-23 shows the conditions at reception.

Setup item	set to
TXD / RXD pin	connected (with 1 channel)
Frame mode specification	8 bits + 2 stop bits
First transfer bit	MSB
Clock source	timer 3
TXD pin type	Nch open-drain
Pull-up resistor of TXD pin	added
Parity bit add / check	"0"add / check
Serial 0 interface interrupt	Enable.

#### Table 10-3-23 UART Interface Transmission Reception Setup

An example setup procedure, with a description of each step is shown below.

	Setup Procedure			Description
(1)	Select the UART commun SC0CTR (x'3F54') bp6 : SC0CMD	ication. = 1	(1)	Set the SC0CMD flag of the SC0CTR register to "1" to select the UART communication.
(2)	Select the first bit to be tra SC0MD0 (x'3F50') bp4 : SC0DIR	ansferred. = 0	(2)	Select MSB as first transfer bit by the SC0DIR flag of the SC0MD0 register.
(3)	Select the start condition. SC0MD0 (x'3F50') bp3 : SC0STE	= 0	(3)	Set the SC0STE flag of the SC0MD0 register to disable start condition. [
(4)	Select the clock source. SC0MD1 (x'3F51') bp4-3 : SC0CK1-0	= 11	(4)	Set the SC0CK1-0 flag of the SC0MD1 register to select timer 3 output as a clock source.
(5)	Select the parity bit. SC0MD2 (x'3F52') bp0 : SC0NPE bp2-1 : SC0PM1-0	= 0 = 00	(5)	Set the SC0NPE flag of the SC0MD2 register to select "parity is enabled", and set the SC0PM1-0 flag to select "0 checked".
(6)	Specify the frame mode. SC0MD2 (x'3F52') bp4-3 : SC0FM1-0	= 11	(6)	Set the SC0FM1-0 flag of the SC0MD2 register to "11" to select 8 bits data + 2 stop bits at the frame mode.
(7)	Select the reception mode SC0MD3 (x'3F53') bp5 : SC0IOM	e. = 1	(7)	Set the SC0IOM flag of the SC0MD3 register to "1" to set the SBO0 to transmission / reception port.

Setup Procedure				Description		
(8)	Control the pin direction. P0DIR (x'3F30') bp0 : P0DIR0	= 0	(8)	Set the P0DIR0 flag of the P0DIR register to "0" to set the TXD pin to input mode.		
(9)	Add pull-up resistor to the P0PLU (x'3F40') bp0 : P0PLU0	TXD pin. = 1	(9)	Set the P0PLU0 flag of the P0PLU register to add pull-up resistor to the TXD pin.		
(10)	Select the interrupt level. SC0ICR (x'03FE8') bp7-6 : SC0LV1-0	= 10	(10)	Select the interrupt level by the SC0LV1-0 flag of the serial interface 0 interrupt control register (SC0ICR).		
(11)	Enable the interrupt. SC0ICR (x'3FE8') bp1 : SC0IE	= 1	(11)	Set the SCOIE flag of the SCOICR register to "1" to enable the interrupt request. If any interrupt request flag had already been set, clear it. [ Chapter 3. 3-1-4 Interrupt Flag Setup ]		
(12)	Set the baud rate timer.		(12)	Set the baud rate timer by the TM3MD register, TM3OC register. And set the TM3EN flag to "1" to operate timer 3.		
(13)	Set the serial interface cor SC0MD3 (x'3F53') bp1 : SC0SBIS	nmunication. = 1	(13)	Set the SC0SBIS flag of the SC0MD3 register to "1" to set the serial interface communication.		
(14)	Start the serial interface re Received data → Input		(14)	After start bit is received by inputting serial interface data from the TXD pin, the received data is stored to the serial interface transmission / reception shift register (SC0TRB). When the reception has completed, the serial interface 0 interrupt (SC0IRQ) is generated, then, the received data is stored to the received buffer (SC0RXB).		

When the TXD / RXD pin are connected for communication with 1 channel, the TXD pin inputs / outputs serial data. The port direction control register P0DIR should be set, for switching input / output. At reception, the SC0SBIS flag of the SC0MD3 register should be set to "1" and select "serial interface data input". The RXD pin can be used as a general port.

	Only timer 3 can be used as a baud rate timer. For baud rate setup, refer to Chapter 5. 5-8 Serial Interface Transfer Clock Output.
ĺ	Serial interface 0 is operated by setting the SC0SBOS flag or the SC0SBIS flag of the SC0MD3 register to "1". The SC0SBOS flag or the SC0SBIS flag should be set after all conditions are set. After that, at reception, the communication is started by receiving start bit.

When a register except the SC0TRB is written / rewritten, set the SC0SBOS, the SC0SBIS flag of the SC0MD3 register to "0", in advance.

When the TXD / RXD pin are connected for communication with 1 channel, the TXD pin inputs / outputs serial data. The port direction control register P0DIR should be set, for switching input / output. The RXD pin can be used as a general port.

When the serial interface port is enabled, if the SC0CE1-0 flag of the SC0MD0 register is switched, the transfer bit count may be changed. If it is used as half-duplex UART serial interface, setting the SC0CE1-0 flag fixed to "00" is recommended.

After reception has completed, the TXD pin is "H" level.

If the frame mode is set by the SC0FM flag of the SC0MD2 register, the SC0LNG2-0 flag of the SC0MD0 register is automatically set.

After the transfer has completed, the transfer bit count in the SC0LNG2-0 flag of the SC0MD0 register is automatically set.

ſ	9
l	

At UART reception, set the SC0SBIS flag of the SC0MD3 register to "1", and set the SC0SBOS flag to "0". Setting both of flags to "1" is disabled.

# Chapter 11 Serial Interface 1

## 11-1 Overview

This LSI contains a serial interface 1 can be used for clock synchronous serial interface communication.

### 11-1-1 Functions

Table 11-1-1 shows functions of serial interface 1.

Communication style	clock synchronous			
Interrupt	SC1IRQ			
Used pins	SBO1,SBI1,SBT1			
3 channels type	$\checkmark$			
2 channels type	-			
Selection of start condition	$\checkmark$

Set fs/2 as maximum frequency for external clock.

## 11-1-2 Block Diagram

■Serial Interface 1 Block Diagram

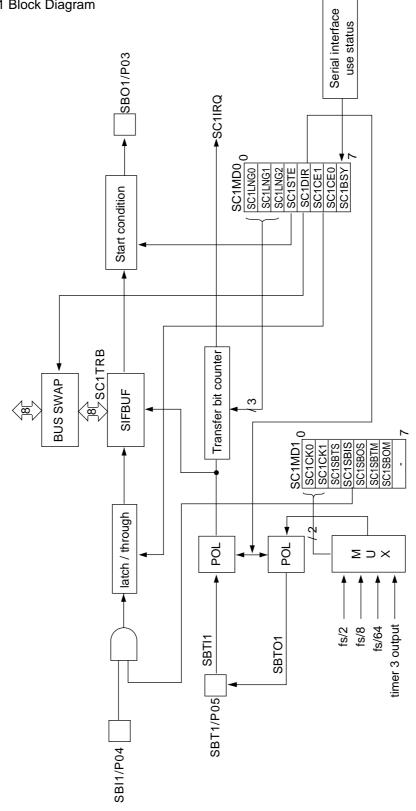

Figure 11-1-1 Serial Interface 1 Block Diagram

## 11-2 Control Registers

## 11-2-1 Registers

Table 11-2-1 shows registers to control serial interface 1.

	Register	Address	R/W	Function	Page
	SC1MD0	x'03F57'	R/W	Serial interface 1 mode register 0	XI - 6
Serial 1	SC1MD1	x'03F58'	R/W	Serial interface 1 mode register 1	
	SC1TRB	x'03F59'	R/W	Serial interface 1 transmission / reception shift register	XI - 5

R/W : Readable / Writable

## 11-2-2 Data Register

Serial Interface 1 has a 8-bit data shift register to shift the transmission and reception data.

Serial Interface 1 Transmission / Reception Shift Register (SC1TRB)

Figure 11-2-1 Serial Interface 1 Transmission / Reception Shift Register (SC1TRB : x'03F59', R/W)

### 11-2-3 Mode Registers

■Serial Interface 1 Mode Register 0 (SC1MD0) SC1BSY flag is only for reading.

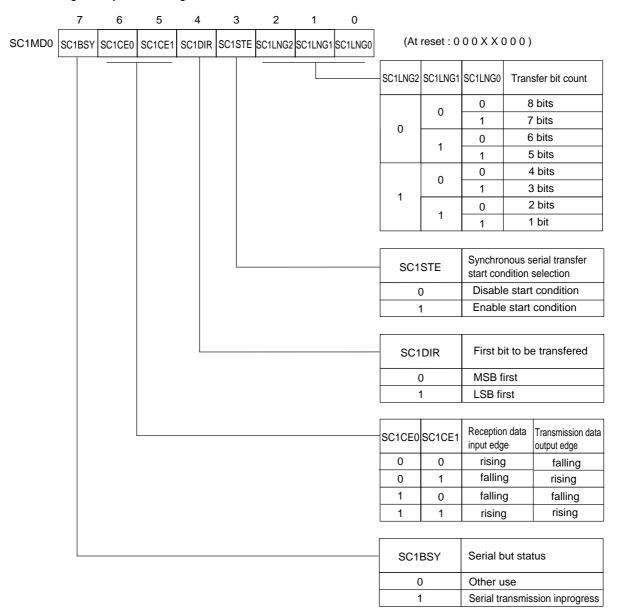

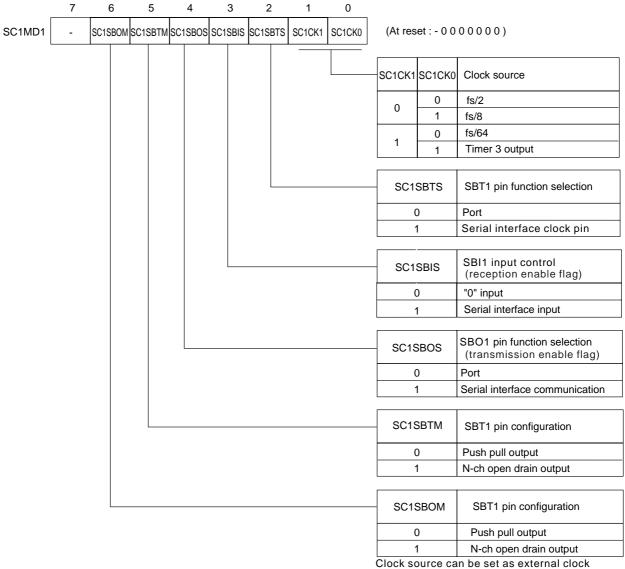

Figure 11-2-2 Serial Interface 1 Mode Register 0 (SC1MD0 : x'03F57', R/W)

#### ■Serial Interface 1 Mode Register 1 (SC1MD1)

Clock source can be set as external clock by setting the SBT1 pin to input mode.

#### Figure 11-2-3 Serial Interface 1 Mode Register 1 (SC1MD1 : x'03F58', R/W)

## 11-3 Operation

Serial Interface 1 can be used for clock synchronous serial interface.

### 11-3-1 Clock Synchronous Serial Interface

■Activation Factor for Communication

Table 11-3-1 shows activation factors for communication. At master, the transfer clock is generated by setting data to the transmission / reception shift register SC1TRB, or by receiving a start condition. At slave, input an external clock, or input an external clock after a start condition is input.

Operation mode			Activation Factor	Sequence communication	
	Master	Start condition is enabled	Writing data to serial buffer	$\checkmark$	
Treneniesien	communication	Start condition is disabled	Writing data to serial buffer	$\checkmark$	
Transmission	Slave communication	Start condition is enabled	Clock reception *	$\checkmark$	
		Start condition is disabled	Clock reception	$\checkmark$	
	Master communication	Start condition is enabled	Start condition is received	$\checkmark$	
Descriter		Start condition is disabled	Writing data to serial buffer	-	
Reception	Slave communication	Start condition is enabled	Start condition is received	$\checkmark$	
		Start condition is disabled	Clock reception	$\checkmark$	

Table 11-3-1 Synchronous Serial Interface Activation Factor

\* When the SC1SBOS flag of the serial interface 1 mode register 1 (SC1MD1) is "1", start condition is output by writing the transmission data to the transmission / reception shift register SC1TRB, then the transmission is started by the slave clock.

When synchronous serial interface is used for master clock reception, it is necessary to write dummy data to the transmission / reception shift register (SC1TRB) for starting master clock. Automatic sequence reception with automatic data transfer can not be used, because it is necessary to write dummy data to serial interface buffer and to read reception data per a frame reception.

Serial data communication of serial interface 1 can be available by setting the SC1SBOS flag or the SC1SBIS flag of the SC1MD1 register to "1". The SC1SBOS flag or the SC1SBIS flag should be set to "1" after all conditions are set.

On the master communication of the clock synchronous, set the SC1SBTS flag to "1" before the SC1SBIS flag or the SC1SBOS flag of the SC1MD1 register is set to "1". But, at the slave communication, the SC1SBTS flag need not to be set to "1".

#### ■Transfer Bit Count

The transfer bit count is selected from 1 bit to 8 bits. Set it by the SC1LNG 2 to 0 flag of the SC1MD0 register (at reset : 000).

The SC1LNG2 to 0 flags change at the opposite edge of the transmission data output edge.

After the transfer has completed, the transfer bit count in the SC1LNG2 to 0 flags of the SC1MD0 register is changed. Except in an 8-bit transfer, reset the transfer bit count at the time of the next transmission.

When the SC1SBOS flag or the SC1SBIS flag of the SC1MD1 register to "1" and the SC1CE1 to 0 flags of the SC1MD0 register are changed, the transfer bit count in the SC1LNG2 to 0 flags of the SC1MD0 register may be incremented.

#### ■Start Condition Setup

Wether or not the start condition is set is controlled by the SC1STE flag of the SC1MD0 register. If a start condition is enabled, and it is being set, a bit counter is cleared to start the communication. After the SC1CE1 flag of the SC1MD0 register is cleared to "0", the start condition is received when a data line (SBI1 pin) is changed from "H" to "L" as a clock line (SBT1 pin) is "H". Also, the SC1CE1 flag is set to "1", that is received when a data line (SBI1 pin) is changed from "H" to (SBI1 pin) is changed from "H" to "L".

Enabling the start condition drives the SBO1 pin high level for a fixed time interval (1/2 the clock source cycle) after the transmission has completed. If the start condition is disabled, the SBO1 pin will remain at the level of the last data bit.

If the start condition is enabled, the SC1LNG2 to 0 flags of the SC1MD0 register will be cleared when the start condition is received. In this case, the receive bit count is fixed at 8 bits.

#### ■First Transfer Bit Setup

Either MSB or LSB can be selected as a first transfer bit by the SC1DIR flag of the SC1MD0 register.

#### Transmission / Reception Data Buffer

The transmission reception shift register, SC1TRB is used as the data register for transmission and reception. Data to be transferred should be set to the SC1TRB. The data is output in sync with the transfer clock and is stored to the SC1TRB bit by bit.

When switching from transmission to reception, set the SC1SBOS flag of the SC1MD1 register to "0" and then set the SC1SBIS flag to "1". Do not change both of these flags at the same time.

When switching from reception to transmission, set the SC1SBIS flag of the SC1MD1 register to "0" and then set the SC1SBOS flag to "1". Do not change both of these flags at the same time.

#### ■Tranfer Bit Count and First Transfer Bit

On transmission, when the transfer bit is 1 bit to 7 bits, the data storing method to the transmission / reception shift register SC1TRB is different, depending on the first transfer bit selection. At MSB first, use the upper bits of SC1TRB. When there are 6 bits to be transferred, as shown on figure 11-3-1-1, if data "A" to "F" are stored to bp2 to bp7 of SC1TRB, the transmission is started from "F" to "A". At LSB first, use the lower bits on the program. When there are 6 bits to be transferred, as shown on figure 11-3-1-2, if data "A" to "F" are stored to bp0 to bp5 on the program, the transmission is started from "A" to "F", because their order is changed in the SWAP circuit.

Figure 11-3-1-1 Transfer Bit Count and First Transfer Bit (starting with MSB)

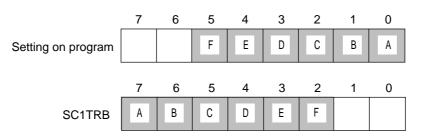

Figure 11-3-1-2 Transfer Bit Count and First Transfer Bit (starting with LSB)

#### ■Receive Bit Count and First Transfer Bit

On reception, when the transfer bit count is 1 bit to 7 bits, the data reading method from the transmission / reception shift register SC1TRB is different depending on the first transfer bit selection. At MSB first, data are read from the lower bits of SC1TRB. When there are 6 bits to be transferred, as shown on figure 11-3-2-1, if data "F" to "A" are stored to bp0 to bp5 of SC1TRB. Also, data are read as the same way. At LSB first, data are read from the upper bits of SC1TRB. When there are 6 bits to be transferred, as shown on figure 11-3-2-2, if data "A" to "F" are stored to bp0 to bp5 of SC1TRB. But their order is changed in the SWAP circuit, and reading is started from the upper bits.

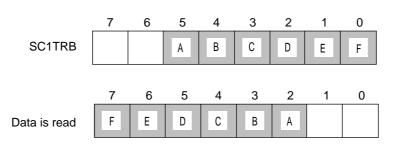

Figure 11-3-2-2 Receive Bit Count and Transfer First Bit (starting with LSB bit)

#### ■Input Edge / Output Edge Setup

The SC1CE1 to 0 flag of the SC1MD0 register set an output edge of the transmission data, an input edge of the reception data. As the SC1CE1 flag = "0", the transmission data is output at the falling edge, and as "1", output at the rising edge. As SC1CE0="0", the reception data is stored at the inversion edge to the output edge of transmission data, and as "1", stored at the same edge.

SC1CE0	SC1CE1	Received data input edge	Transmission data output edge
0	0		• • • • • • • • • • • • • • • • • • •
0	1	¥	
1	0		
1	1		

Table 11-3-2 Transmission Data Output Edge and Received Data Input Edge

#### ■Clock Setup

The internal clock or the external clock can be selected as clock source. Table 11-3-3 shows internal clock source that the SC1CK1 to 0 register of the SC1MD1 register can set.

	Serial interface 1
Clock source (internal clock)	fs/2
	fs/8
	fs/64
	Timer 3 output

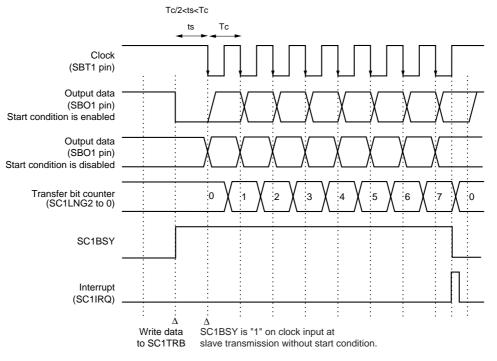

#### ■Data Input Pin Setup

Only 3 channels type (clock pin (SBT1 pin), data output pin (SBO1 pin), data input pin (SBI1 pin)) can be selected as the communication mode. SBI1 pin can be used for serial data input. SBO1 pin can be used for serial data output. If only transmission is operated, the SBI1 pin can be used as general I/O pin. And if only reception is operated, the SBO1 pin can be used as general I/O pin.

#### ■BUSY Flag

When the activation factor is generated, shown in table 11-3-1, and the serial interface communication is started, the BUSY flag SC1BSY of the SC1MD0 register is set to "1". That is cleared to "0" when the communication complete interrupt SC1IRQ is generated.

#### ■Trasnmission Timing

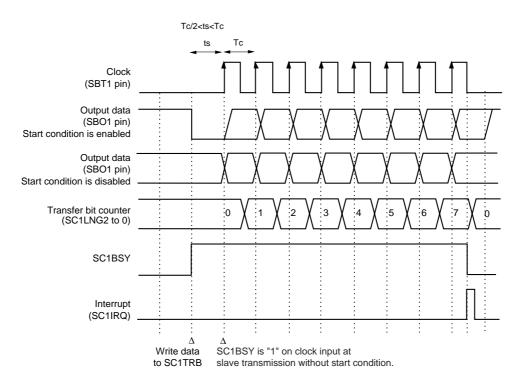

Figure 11-3-4 Transmission Timing (at rising edge)

#### ■Reception Timing

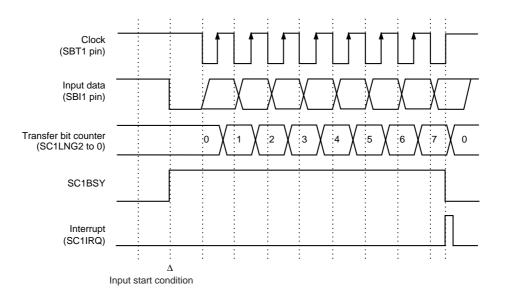

Figure 11-3-5 Reception Timing (at rising edge, start condition is enabled)

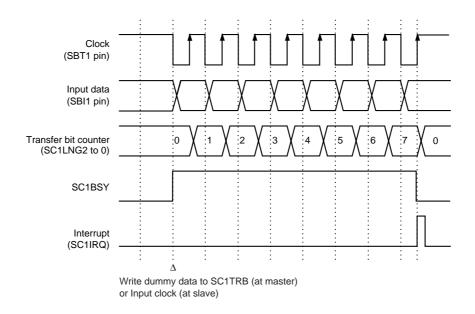

Figure 11-3-6 Reception Timing (at rising edge, start condition is disabled)

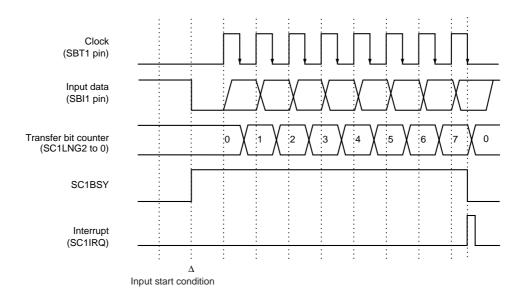

Figure 11-3-7 Reception Timing (at falling edge, start condition is enabled)

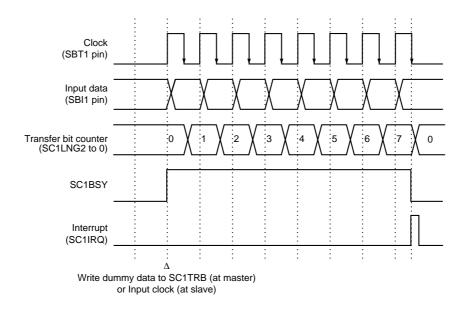

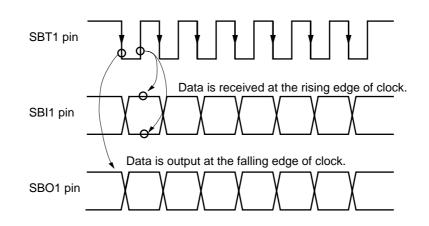

Figure 11-3-8 Reception Timing (at falling edge, start condition is disabled)

#### ■Transmission / Reception Simultaneous Timing

When transmission and reception are operated at the same time, set the SC1CE0 to 1 flag of the SC1MD0 register to "00" or "01". Data is received at the opposite edge of the transmission clock, so that the reception clock should be the opposite edge of the transmission clock from the other side.

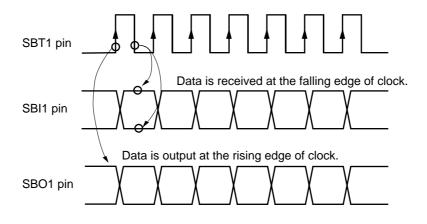

Figure 11-3-10 Transmission / Reception Timing (Reception : at falling edge, Transmission : at rising edge) (SC1CE0=0, SC1CE1=1)

■Pins Setup (3 channels type, at transmission)

Table 11-3-4 shows the setup for synchronous serial interface pin with 3 channels (SBO1 pin, SBI1 pin, SBT1 pin) at transmission.

	Data output pin	Data input pin	Clock I/O pin	
Setup item			SBT1 pin	
	SBO1 pin	SBI1 pin	Internal clock	External clock
Pin	P03	P04	P05

# Table 11-3-6Setup for Synchronous Serial Interface Pin<br/>(3 channels type, at transmission / reception)

## 11-3-2 Setup Example

#### ■Transmission / Reception Setup Example

The setup example for clock synchronous serial interface communication with serial interface 1 is shown. Table 11-3-7 shows the conditions at transmission / reception.

		•	
Setup item	set to	Setup item	set to
Transfer bit count	8 bits	Clock source	fs/2
Start condition	none	SBT1/SBO1 pin style	N-ch open-drain
First transfer bit	MSB	SBT1 pin pull-up resistor	Not added
Innut data adra	folling odgo	SBO1 pin pull-up resistor	Not added
Input data edge	falling edge	SBI1 pin pull-up resistor	Added
Output data edge	rising edge	Serial interface 1 interrupt	Enable
Clock	Internal clock (master communication)		

## Table 11-3-7 Setup Examples for Synchronous Serial Interface Transmission / Reception

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
<ul> <li>(1) Set the SC1MD0 register.</li> <li>Select the transfer bit count.</li> <li>SC1MD0 (x'3F57')</li> <li>bp2-0 : SC1LNG2-0 = 000</li> </ul>	(1) Set the SC1LNG2-0 flag of the serial interface 1 mode register 0 (SC1MD0) to "000" to set the transfer bit count "8 bits".
Select the start condition. SC1MD0 (x'3F57') bp3 : SC1STE = 0	Set the SC1STE flag of the SC1MD0 register to "0" to disable start condition.
Select the first bit to be transferred. SC1MD0 (x'3F57') bp4 : SC1DIR = 0	Set the SC1DIR flag of the SC1MD0 register to "0" to set MSB as a first transfer bit.
Select the transfer edge. SC1MD0 (x'3F57') bp6 : SC1CE0 = 0 bp5 : SC1CE1 = 1	Set the SC1CE0, 1 flag of the SC1MD0 register to "0, 1" to set the transmission data output edge to "rising" and the received data input edge to "falling".

Setup Procedure			Description	
(2)	Select the clock source. SC1MD1 (x'3F58') bp1-0 : SC1CK1-0 = 00	(2)	Set the SC1CK1-0 flag of the SC1MD1 register to "00" to select "fs/2" as a clock source.	
(3)	Select the transfer clock. SC1MD1 (x'3F58') bp2 : SC1SBTS = 1	(3)	Set the SC1SBTS flag of the SC1MD1 register to "1" to set the SBT1 pin to serial interface clock I/O pin. The communication is with internal clock (master communication).	
(4)	Control the pin type. SC1MD1 (x'3F58') bp6-5 : SC1SBOM, SC1SBTM = 11 P0PLU (x'3F40') bp5-3 : P0PLU5-3 = 010	(4)	Set the SC1SBOM, SC1SBTM flag of the SC1MD1 register to "11" to select "N-ch open drain" to the SBO1/SBT1 pin. Set the P0PLU5-3 flag of the P0PLU register to "010" to add pull-up resistor only to the SBI1 pin.	
(5)	Control the pin direction. P0DIR (x'3F30') bp5-3 : P0DIR5-3 = 101	(5)	Set the P0DIR5-3 flag of the port 0 pin's direction control register (P0DIR) to "101" to set P03, P05 "output mode", and to set P04 "input mode".	
(6)	Control the pin function.SC1MD1 (x'3F58')bp4 : SC1SBOSbp3 : SC1SBIS= 1	(6)	Set the SC1SBOS, SC1SBIS flag of the SC1MD1 register to "1" to set the SBO1 pin to "serial interface data output", the SBI1 pin to "serial interface data input".	
(7)	Set the interrupt level. SC1ICR (x'03FF1') bp7-6 : SC1LV1-0 = 10	(7)	Set the interrupt level by the SC1LV1-0 flag of the serial interface 1 interrupt control register (SC1ICR).	
(8)	Enable the interrupt. SC1ICR (x'3FF1') bp1 : SC1IE = 1	(8)	Set the SC1IE flag of the SC1ICR register to "1" to enable interrupts. If the interrupt request flag (SC1IR of the SC1ICR register) had already been set, clear SC1IR before an interrupt is enabled. [ Chapter 3 3-1-4. Interrupt Flag Setup ]	
(9)	Start serial interface transmission. Transmission data→SC1TRB (x'3F5 Reception data→input to SBI1 pin.	(9)	Set the transmission data to the serial interface 1 transmission / reception shift register (SC1TRB). Then, an internal clock is generated to start transmission / reception. After transmission has finished, serial interface 1 interrupt SC1IRQ is generated.	

When only reception with 3 channels is operated, set SC1SBOS of the SC1MD1 register to "0" and select a port. The SBO1 pin can be used as a general port.

When the register except the SC1TRB is written or rewritten, set the SC1SBOS, SC1SBIS flag to "0".

When the internal clock is used as clock source, write dummy data to the SC1TRB register after setting the SC1SBIS flag and the SC1SBOS flag of the SC1MD1 register to "1". Even if the reception is operated again, write dummy data to the SC1TRB register.

# Chapter 12 Serial Interface 2

## 12-1 Overview

This LSI contains a serial interface 2 that can be used for both communication types of clock synchronous and simple IIC (single master).

### 12-1-1 Functions

Table 12-1-1 shows functions of serial interface 2.

Communication style	clock synchronous	IIC (single master)	
Interrupt	SC2IRQ	SC2IRQ	
Used pins	SBO2,SBI2,SBT2	SDA,SCL	
3 channels type		-	
2 channels type	$\sqrt{(SBO2,SBT2)}$		
Selection of start condition	1	software setting by port function	
Transfer bit count	1 to 8 bit	1 to 8 bit + ACK bit	
Specification of the first transfer bit	1	$\checkmark$	
Specification of input edge		falling edge	
ACK bit	-	$\checkmark$	
ACK bit level	-	$\checkmark$	
Clock source	fs/4 fs/8 fs/16 fs/32 1/4 dividing Timer 0 output External clock	fs/4 fs/8 fs/16 fs/32 1/4 dividing Timer 0 output	
Maximum transfer rate	2.5 MHz	400 kHz	
fosc : Machine clock (High speed oscillation) fs : System clock (at NORMAL mode : fs=fosc/2, at SLOW mode : fs=fx/4) When the transmission and reception are operated at the same time at master communication of the clock synchronous, select "no start condition".

#### ■Serial Interface 2 Control Register (SC2CTR)

#### The SC2BSY, SC2SPKF and SC2STKF flags are only readable.

# 12-3 Operation

Serial Interface 2 can be used for both clock synchronous and simple IIC (single master).

### 12-3-1 Clock Synchronous Serial Interface

Selection of Clock Synchronous Serial Interface

When the serial interface 2 is used as clock synchronous serial interface, set the SC2CMD flag of the serial interface mode register (SC2MD0) to "0".

■Activation Factor for Communication

Table 12-3-1 shows activation factors for communication. At master, the transfer clock is generated by setting data to the transmission / reception shift register SC2TRB, or by receiving a start condition. At slave, input an external clock, or input an external clock after a start condition is input.

Operation mode			Activation factor	Sequence communication
		Enable start condition	Writing data to serial buffer	
Transmission	at master	Disable start condition	Writing data to serial buffer	
Transmission	at slave	Enable start condition	Clock reception *	
		Disable start condition	Clock reception	
	at master	Enable start condition	Start condition reception	
Decention		Disable start condition	Writing data to serial buffer	_
Reception		Enable start condition	Start condition reception	
	at slave	Disable start condition	Clock reception	

Table 12-3-1	Synchronous Serial Interface Activation Factor
--------------	--

\* Start condition is output by writing the transmission data to the transmission / reception shift register SC2TRB when the SC2SBOS flag of the serial interface 2 mode register 1 (SC2MD1) is set to "1". Then, the transmission is started by the slave clock.

When synchronous serial interface is used for master clock reception, it is necessary to write dummy data to the transmission / reception shift register (SC2TRB) for starting master clock. Automatic sequence reception with automatic data transfer can not be used, because it is necessary to write dummy data to serial interface buffer and to read reception data per a frame reception.

On the master communication of the clock synchronous, set the SC2SBTS flag to "1" before the SC2SBOS flag or the SC2SBIS flag of the SC2MD1 register is set to "1". But, at the slave communication, the SC2SBTS flag need not to be set to "1".

#### ■Transfer Bit Count

The transfer bit count is selected from 1 bit to 8 bits. Set it by the SC2LNG2 to 0 flag of the SC2MD0 register (at reset : 000). The SC2LNG3 flag needs not to be taken care.

The SC2LNG2 to 0 flags change at the opposite edge of the transmission data output edge.

After the transfer has completed, the transfer bit count in the SC2LNG2 to 0 flags of the SC2MD0 register is changed. Except in an 8-bit transfer, reset the transfer bit count at the time of the next transmission.

When the SC2SBOS flag or the SC2SBIS flag of the SC2MD1 register is set to "1" and the SC2CE1 to 0 flags of the SC2MD0 register are changed, the transfer bit count in the SC2LNG2 to 0 flags of the SC2MD0 register may be incremented.

#### ■Start Condition

Whether or not the start condition is set is controlled by the SC2STE flag of the SC2MD0 register. If a start condition is enabled and input, a bit counter is cleared to start the communication. The start condition is regarded when a data line (SBI2 pin (with 3 channels) or SBO2 pin (with 2 channels) is changed from "H" to "L" as a clock line (SBT2 pin) is "H".

When the reception and the transmission should be operated at the same time, disable start condition for proper operation.

Enabling the start condition drives the SBO2 pin high level for a fixed time interval (1/2 the clock source cycle) after the transmission has completed. If the start condition is disabled, the SBO2 pin will remain at the level of the last data bit.

If the start condition is enabled, the SC2LNG2 to 0 flags of the SC2MD0 register will be cleared when the start condition is received. In this case, the receive bit count is fixed at 8 bits.

On the master communication of the clock synchronous, if start condition is enabled, the reception and the transmission should not be operated at the same time. The clock may be continued to output after the communication has completed.

#### ■First Transfer Bit

Either MSB or LSB can be selected as a first transfer bit by the SC2DIR flag of the SC2MD0 register.

#### ■Transmission / Reception Data Buffer

The transmission reception shift register, SC2TRB is used as the data register for transmission and reception. Data to be transferred should be set to the SC2TRB. The data is output in sync with the transfer clock and is stored to the SC2TRB bit by bit.

When switching from transmission to reception, set the SC2SBOS flag of the SC2MD1 register to "0" and then set the SC2SBIS flag to "1". Do not change both of these flags at the same time.

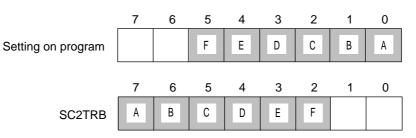

When switching from reception to transmission, set the SC2SBIS flag of the SC2MD1 register to "0" and then set the SC2SBOS flag to "1". Do not change both of these flags at the same time.

#### ■Tranfer Bit Count and First Transfer Bit

On transmission, when the transfer bit is 1 bit to 7 bits, the data storing method to the transmission / reception shift register SC2TRB is different, depending on the first transfer bit selection. At MSB first, use the upper bits of SC2TRB. When there are 6 bits to be transferred, as shown on figure 12-3-1-1, if data "A" to "F" are stored to bp2 to bp7 of SC2TRB, the transmission is started from "F" to "A". At LSB first, use the lower bits on the program. When there are 6 bits to be transferred, as shown on figure 12-3-1-2, if data "A" to "F" are stored to bp0 to bp5 on the program, the transmission is started from "A" to "F", because their order is changed in the SWAP circuit.

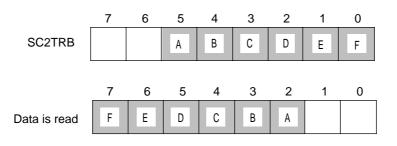

#### ■Receive Bit Count and First Transfer Bit

On reception, when the transfer bit count is 1 bit to 7 bits, the data reading method from the transmission / reception shift register SC2TRB is different depending on the first transfer bit selection. At MSB first, data are read from the lower bits of SC2TRB. When there are 6 bits to be transferred, as shown on figure 12-3-2-1, if data "F" to "A" are stored to bp0 to bp5 of SC2TRB. Also, data are read as the same way. At LSB first, data are read from the upper bits of SC2TRB. When there are 6 bits to be transferred, as shown on figure 12-3-2-2, the reception is started from "A" to "F" and is stored to bp0 to bp5 of SC2TRB. But their order is changed in the SWAP circuit, and reading is started from the upper bits.

#### ■Input Edge / Output Edge Setup

The SC2CE0 flag of the SC2MD0 register set an input edge of the reception data. The transmission data is output at the falling edge of the clock. As SC2CE0="0", the reception data is stored in sync with the inversion edge of the transmission data output edge, and as SC2CE0="1", it is stored at the same edge.

Table 12-3-2 Input Edge and Output Edge of Transmission Reception Data

SC2CE0	Reception data input edge	Transmission data output edge
0		
1		

#### ■Clock Setup

The clock source can be selected from the internal clock or the external clock. Here is the internal clock source that can be set by the SC2CK2 to 0 register of the SC2MD1 register.

Table 12-3-3 Synchronous Serial Interface Internal Clock Source

	Serial interface 2	
	fs/4	
	fs/8	
Clock source (internal clock)	fs/16	
	fs/32	
	1/4 dividing Timer 0 output	

#### ■Data Input Pin Setup

3 channels type (clock pin (SBT2 pin), data output pin (SBO2 pin), data input pin (SBI2 pin)) or 2 channels type (clock pin (SBT2 pin), data I/O pin (SBO2 pin)) can be selected as the communication. SBI2 pin can be used for only serial data input. SBO2 pin can be used for serial data input or output. The SC2IOM flag of the SC2CTR register can select if the serial data is input from SBI2 pin or SBO2 pin. When "data input from SBO2 pin" is selected to set the 2 channels type, the P3DIR0 flag of the P3DIR register controls direction of SBO2 pin to switch transmission / reception. At that time, SBI2 pin is free to be used as a general port.

At reception, if SC2IOM of the SC2CTR register is set to "1" and "serial data input from SBO2 pin" is selected, SBI2 pin is used as a general port.

#### ■BUSY Flag

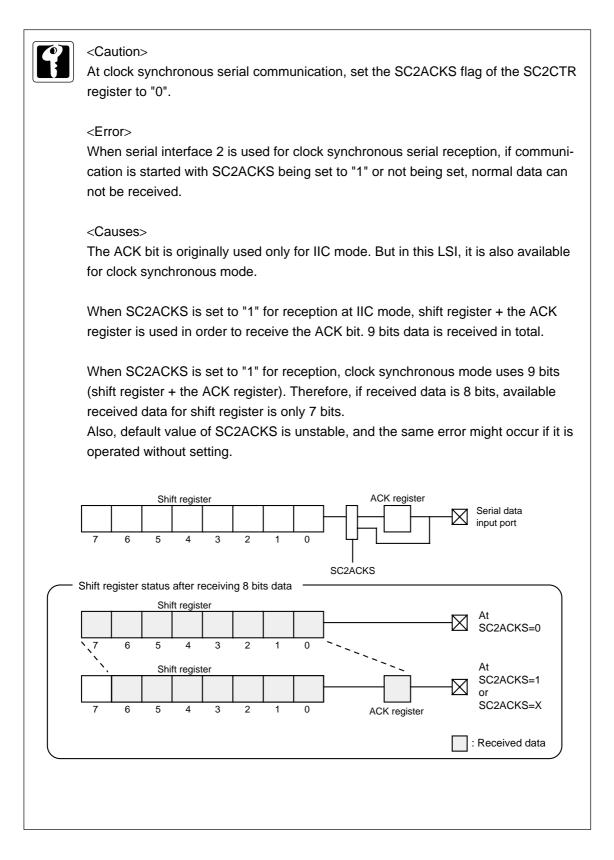

When the activation factor is generated, shown in table 12-3-1, and the serial interface communication is started, the BUSY flag SC2BSY of the SC2CTR register is set to "1". That is cleared to "0" when the communication complete interrupt SC2IRQ is generated.

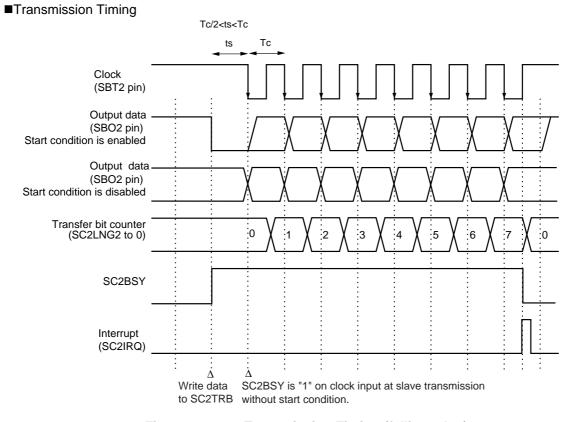

#### ■Other Control Flag Setup

Table 12-3-4 shows flags that are not used at clock synchronous communication. So, they need not to be set or monitored.

Register	Flag	Detail	
SC2MD0	SC2LNG3	Transfer bit count specification 3	
	SC2ACK0	ACK bit level specification	
	SC2STEN	Start condition flag enable	
SC2CTR	SC2SPEN	Stop condition flag enable	
	SC2STKF	Start condition detection	
	SC2SPKF	Stop condition detection	

#### Table 12-3-4 Other Control Flag

#### ■Reception Timing

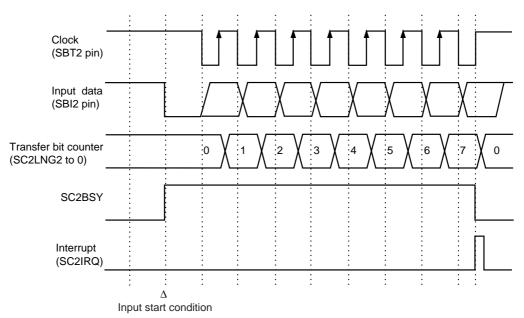

Figure 12-3-4 Reception Timing (rising edge, start condition is enabled)

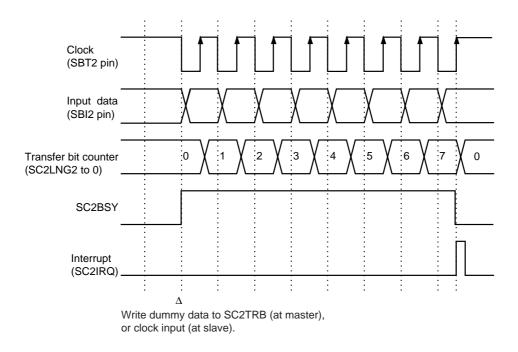

Figure 12-3-5 Reception Timing (rising edge, start condition is disabled)

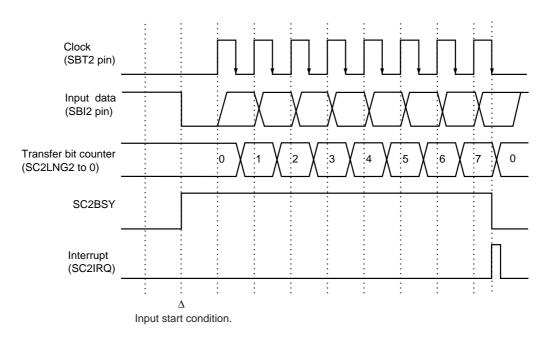

Figure 12-3-6 Reception Timing (falling edge, start condition is enabled)

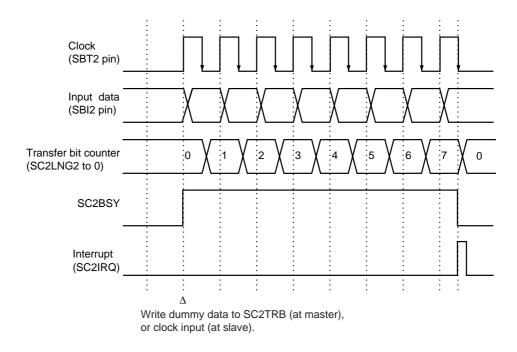

Figure 12-3-7 Reception Timing (falling edge, start condition is disabled)

#### Transmission / Reception Simultaneous Timing

When transmission and reception are operated at the same time, set the SC2CE0 flag of the SC2MD0 register to "0". Data is received at the opposite edge of the transmission clock, so that the reception clock should be the opposite edge of the transmission clock from the other side.

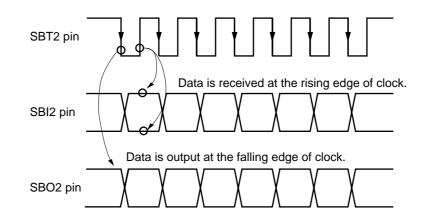

Figure 12-3-8 Transmission / Reception Timing (Reception : rising edge, Transmission : falling edge) (SC2CE0= 0)

#### ■Pins Setup (3 channels, at transmission)

Table 12-3-5 shows the setup for synchronous serial interface pin with 3 channels (SBO2 pin, SBI2 pin, SBT2 pin) at transmission.

# 12-3-2 Setup Example

#### ■Transmission / Reception Setup Example

The setup example for clock synchronous serial interface communication with serial interface 2 is shown. Table 12-3-10 shows the conditions at transmission / reception.

Table 12-3-10	Setup Examples for Synchronous Serial Interface Transmission / Reception
---------------	--

Setup item	set to		Setup item	set to	
SBI2 / SBO2 pin	Independent (with 3 channels)		Clock source	fs/4	
Transfer bit count	8 bits				
Start condition	none		SBT2 / SBO2 pin style	Nch open-drain	
First transfer bit	MSB		SBT2 pin pull-up resistor	Not added	
Innut clock odgo	riging odgo		SBO2 pin pull-up resistor Not added		
Input clock edge	e rising edge		SBI2 pin pull-up resistor	Added	
Output clock edge	falling edge		Serial 2 communication complete interrupt	Enable	
Clock	Internal clock (master communication)				

An example setup procedure, with a description of each step is shown below.

		up Procedure			Description
(1)	Select the cl	ock synchronous s	serial	(1)	Set the SC2CMD flag of the serial interface 2
	interface.	·			mode register (SC2MD0) to "0" to select the
	SC2MD0 (	x'3F5A')			clock synchronous serial interface.
	bp6	: SC2CMD	= 0		
	SC2CTR (	x'3F5C')			Set the SC2ACKS flag of the serial interface 2
	bp1	: SC2ACKS	= 0		control register (SC2CTR) to "0".
(2)	Set the SC2	MD0 register.		(2)	Set the SC2LNG3-0 flag of the serial interface
	Select the tra	ansfer bit count			2 mode register 0 (SC2MD0) to"1000" to set
	SC2MD0 (	x'3F5A')			the transfer bit to 8 bits.
	bp3-0	: SC2LNG3-0	= 1000		
					Set the SC2STE flag of the SC2MD0 register
		art condition.			to "0" to disable start condition.
	SC2MD0 (	x'3F5A')			
	bp4	: SC2STE	= 0		
					Set the SC2DIR flag of the SC2MD0 register to
	Select the fir	st bit to be transfe	erred.		"0" to set MSB as a transfer first bit.
	SC2MD0 (	x'3F5A')			
	bp5	: SC2DIR	= 0		

	Setup Procedure			Description
	Select the transfer edge. SC2MD0 (x'3F5A') bp7 : SC2CE0	= 0		Set the SC2CE0 flag of the SC2MD0 register to "0" to set the transmission data output edge "falling" and the received data input edge "rising".
(3)	Select the clock source. SC2MD1 (x'3F5B') bp2-0 : SC2CK2-0	= 000	(3)	Set the SC2CK2-0 flag of the SC2MD1 register to "000" to select the clock source "fs/4".
(4)	Select the transfer clock. SC2MD1 (x'3F5B') bp3 : SC2BTS	= 1	(4)	Set the SC2SBTS flag of the SC2MD1 register to "1" to set the SBT2 pin to serial interface clock I/O pin. The communication is used with the internal clock (master communication).
(5)	Control the pin type. SC2MD1 (x'3F5B') bp7-6 : SC2SBOM, SC2 SC2CTR (x'3F5C') bp6 : SC2IOM P3PLU (x'3F43') bp2-0 : P3PLU2-0	2SBTM = 11 = 0 = 010	(5)	Set the SC2SBOM, SC2SBTM flag of the SC2MD1 register to "11" to select the SBO2/ SBT2 pin to "N-ch open drain". Set the SC2IOM flag to "0" to set "input serial data from the SBI2 pin". Set the P3PLU2-0 flag of the P3PLU register to "010" to select "add pull-up resistor only to the SBI2 pin.
(6)	Control the pin direction. P3DIR (x'3F33') bp2-0 : P3DIR2-0	= 101	(6)	Set the P3DIR2-0 flag of the port 3 pin direction control register (P3DIR) to "101" to set P30 and P32 to output mode and to set P31 to input mode.
(7)	Control the pin function. SC2MD1 (x'3F5B') bp5 : SC2SBOS bp4 : SC2SBIS	= 1 = 1	(7)	Set the SC2SBOS, SC2SBIS flag of the SC2MD1 register to "1" to set SBO2 pin "serial data output", SBI2 pin "serial data input".
(8)	Set the interrupt level. SC2ICR (x'3FF2') bp7-6 : SC2LV1-0	= 10	(8)	Set the interrupt level by the SC2LV1-0 flag of the serial interface 2 interrupt control register (SC2ICR).
(9)	Enable the interrupt. SC2ICR (x'3FF2') bp1 : SC2IE	= 1	(9)	Set the SC2IE flag of the SC2ICR register to "1" to enable interrupts. If the interrupt request flag (SC2IR of the SC2ICR register) had already been set, clear SC2IR before an interrupt is enabled. [ C Chapter 3 3-1-4. Interrupt Flag Setup ]

Setup Procedure	Description
<ul> <li>(10) Start serial interface transmission.</li> <li>Transmission data→SC2TRB (x'3F5D')</li> <li>Reception data→input to SBI2 pin.</li> </ul>	<ul> <li>(10) Set the transmission data to the serial interface 2 transmission / reception shift register (SC2TRB). Then, an internal clock is generated to start transmission / reception. After the transmission has finished, serial interface 2 interrupt SC2IRQ is generated.</li> </ul>

Note : In (2), each settings can be set at once.

When only reception with 3 channels is operated, set SC2SBOS of the SC2MD1 register to "0" and select a port. The SBO2 pin can be used as a general port.

When SBO2 / SBI2 pin are connected for communication with 2 lines, the SBO2 pin inputs / outputs serial data. The port direction control register P3DIR switches input / output. At reception, set SC2SBIS of the SC2MD1 register always to "1" to select "serial data input". The SBI2 pin can be used as a general port.

If the SC2IOM flag of the SC2MD1 register is set to "1", the SBI2 pin can be used as port. When the SBO2 pin is input mode, reception is operated, and when it is output mode, transmission is operated.

When the register except the SC2TRB is written or rewritten, set the SC2SBOS, SC2SBIS flag to "0".

When the internal clock is used as clock source, write dummy data to the SC2TRB register after setting the SC2SBIS flag and the SC2SBOS flag of the SC2MD1 register to "1". Even if the reception is operated again, write dummy data to the SC2TRB register.

### 12-3-3 Single Master IIC Interface

IIC serial communication in single master is available at serial interface 2. Several devices can be connected to this serial interface 2 as slave.

Table 12-3-11 shows the functions of IIC serial interface.

Communication type	Single master IIC
Interrupt	SC2IRQ
Pins	SDA(P30), SCL(P32)
Transfer bit count	1 to 8 bits + ACK bit
First transfer bit	$\checkmark$
ACK bit	$\checkmark$
ACK bit level	
Clock source	fs/4 fs/8 fs/16 fs/32 1/4 dividing timer 0 output

#### ■Start Condition Setup

The program using data output function of a general port generates start condition. Set the SDA pin (P30) and the SCL pin (P32) to port and output "H" level. After that, when "L" level is output to the SDA pin (P30), devises as slave connected to this LSI recognize start condition (When the clock line is "H", the data line changes from "H" to "L".).

Be sure to set the SC2STE flag of the SC2MD0 register to "0" (disable start condition).

#### Activation Factor for Communication

Set data (at transmission) or dummy data (at reception) to the transmit/reception shift register SC2TRB. Transfer clock is generated to start communication, regardless of transmission/reception. This serial interface can not be used for slave communication.

#### ■Generation of Stop Condition

Stop condition is generated as the SDA line is changed from "L" to "H", when the SCL line is "H". For this generation, use the program with data output function of a general port.

Set the SDA pin (P30) and the SCL pin (P32) to port and output "L" level to them. After this, set the SCL pin to "H" level and output "H" level to the SDA pin.

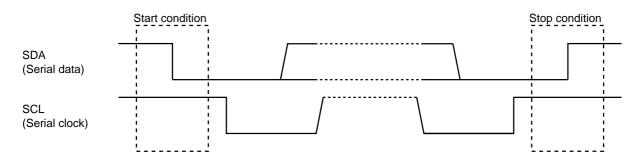

Figure 12-3-9 Start Condition and Stop Condition

#### ■Input Edge/Output Edge Setup

At IIC communication, data is always received in sync with the falling edge of clock. Set the SC2CE0 flag of the SC2MD0 register to "1", and select "falling" at the received data input edge.

At IIC communication, set the SC2CE0 flag of the SC2MD0 register to "1" to select "falling" of the received data input edge.

#### ■Data I/O Pin Setup

The SDA pin (usable as the SBO2 pin, too) is used to input/output data. Set the SC2IOM flag of the SC2CTR register to "1" to input serial data from the SBO2 pin. The SBI2 pin is not used, so it can be used as a general port. But, always set the SC2SBIS flag of the SC2MD1 register to "1" to set "input serial data".

#### ■Pin Style Setup

During data communication, set the SC2SBOM flag and the SC2SBTM flag of the SC2MD1 register to "1" to select N-ch open-drain for the output style of the SDA pin (P30) and the SCL pin (P32). Above procedure leads the SDA pin and the SCL pin to output "L" level or to be opened.

#### ■Reception of Confirming (ACK Bit) after Data Transmission

The SC2ACKS flag of the SC2CTR register selects if the ACK bit is enabled or not. If the ACK bit is enabled, the ACK bit is received from the slave station after data (1 to 8 bits) is transferred. If the transfer bit count of this LSI is set to data (1 to 8 bits) + 1 bit (for the ACK bit ) and the SC2ACKO flag is set to "1", the ACK bit (of "H" level) is output after data transmission. Because output style is N-ch open-drain, SDA line gets to be open. At this time, if devises of slave station give back the ACK bit, that data is stored to the SC2ACKO flag at the falling edge of SCL. When the received the ACK bit level is "L", reception of the slave station is normally operated and the next data is waiting to be received. When the ACK bit level is "H", there is a possibility that reception of the slave station might be completed. So clear the SC2SBIS flag and the SC2SBOS flag of the SC2MD1register to "0" to terminate communication.

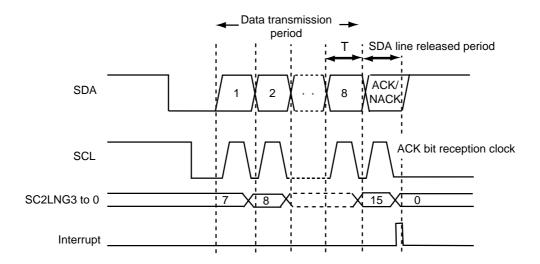

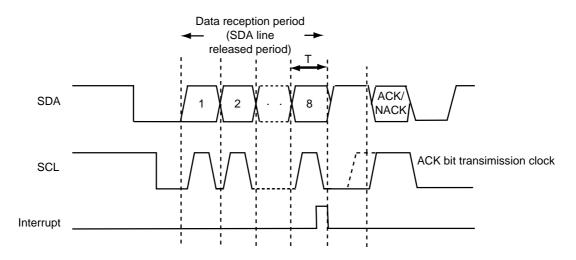

Figure 12-3-10 ACK Bit Reception Timing after Transmission of 8-Bit Data

■Transmission of Confirming (ACK Bit) after Data Reception

After data reception, the ACK bit is transmitted with the program using the data output function of a general port (Set the SC2ACKS flag to '0'.).

#### ■Transfer Format

On IIC bus, there are 2 transfer formats: **the addressing format** that transmits/receives data after 1 byte data (address data) that consists of slave address (7 bits) and R/W bit (1 bit) is transferred after start condition, and **the free data format** that transmits data right after start condition. The serial interface of this LSI supports 2 communication formats only for master transmission and master reception at IIC communication. Sequence of communication is as follows. The shaded parts show the data transferred from slave.

[ Figure 12-3-13 Master Transmission Timing, Figure 12-3-14 Master Reception Timing ]

Start Slav condition addre		ACK	data	ACK	Stop condition
-------------------------------	--	-----	------	-----	-------------------

Addressing format (master transmission)

Start condition	Slave address	R/W	ACK	data	no ACK	Stop condition
-----------------	------------------	-----	-----	------	-----------	-------------------

Addressing format (master transmission)

Start condition	data	ACK	Stop condition
-----------------	------	-----	-------------------

Free data format (master transmission)

#### Figure 12-3-12 Communication Sequence on Each Transfer Format

#### ■Clock Setup

The SC2MD1 register selects the transfer clock of IIC communication from internal clock and timer 0. But clock source should be set so that the transfer rate is not over 400 kHz. This IIC interface can not be used at the external clock (clock slave).

Communication type	Single master IIC		
Clock source (internal clock)	fs/4		
	fs/8		
	fs/16		
	fs/32		
	1/4 dividing timer 0 output		

	Table 12-3-12	IIC Interface	<b>Clock Source</b>
--	---------------	---------------	---------------------

■Transmission/Reception Mode Setup and Operation

The first data always needs to be added start condition for communication. The start condition is output from the master, this serial interface.

If the communication is continued (no stop condition is generated), do not add start condition to the next data. At addressing format, slave address and R/W bit are set to the first data for transmission after start condition is output.

At master reception, in the interrupt service routine followed by the transmission of the first 1byte data, switch to the reception mode after the ACK signal from slave is confirmed. If the communication should be continued to other device without stopping, output start condition and then transmit slave address again. At reception, after the data storage is completed, reception confirmation (the ACK bit) is output. [ Figure 12-3-13 Master Transmission Timing, Figure 12-3-14 Master Reception Timing ]

#### ■IIC BUSY Flag Operation

As data is set to the transmit/receive shift register SC2TRB, the SC2BSY flag of the SC2CTR register is set to "1". After communication is completed, communication complete interrupt SC2IRQ is generated and the SC2BSY flag is automatically cleared.

The following items are the same to the clock synchronous serial. Refer to the following pages.

First Transfer Bit Setup Refer to : XII-11

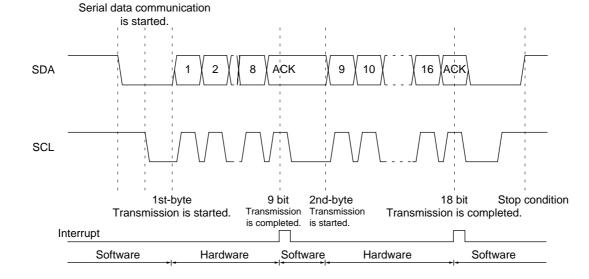

Transmit, Reception Data Buffer Refer to : XII-11

Transfer Bit Count and First Transfer Bit Refer to : XII-12

Received Bit Count and First Transfer Bit Refer to : XII-12

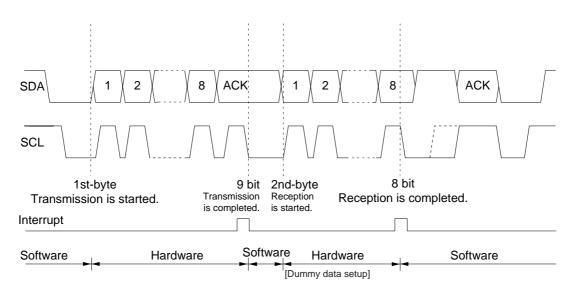

■Other Control Flags

The SC2STEN flag, the SC2SPEN flag, the SC2STKF flag and the SC2SPKF flag of the SC2CTR register can not be used for IIC serial communication in single master. Set them always to "0".

#### ■Master Transmission Timing

Master Reception Timing

Figure 12-3-14 Master Reception Timing

#### ■Pin Setup (2 channels, at transmission)

Table 12-3-13 shows the pins setup at IIC serial interface transmission with 2 channels (the SDA pin, the SCL pin).

lto an	Data I/O pin	Clock output pin

# 12-3-4 Setup Example

#### ■Master Transmission Setup Example

Here is the setup example of data transmission after 1 byte transmission with IIC interface function of serial interface 2. Figure 12-3-15 shows the conditions.

ltem	Set to	ltem	Set to
SBI2/SBO2 pins	Connection (with 2 channels)	Clock source	fs/4
Transfer bit count	8 bits	SCL/SDA pins' type	N-ch open-drain
Start condition	enable (without flag setup)	Pull-up resistance of the SCL pin	added
First transfer bit	MSB	Pull-up resistance of the SDA pin	added
ACK bit	enable		

Figure 12-3-15 Conditions of Single Master IIC Transmission Setup

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description
(1) Output 'H' level to the SCL pin (P32). P3OUT (x'3F13') bp2 : P3OUT2 = 1 P3DIR (x'3F33') bp2 : P3DIR2 = 1	(1) Set the P3OUT2 flag of the port 3 output register to "1" (H level) and the P3DIR2 flag of the port 3 direc- tion register to "1" (output mode) to output 'H' level to the SCL pin (P32).
(2) Output 'H' level to the SDA pin (P30). P3OUT (x'3F13') bp0 : P3OUT0 = 1 P3DIR (x'3F33') bp0 : P3DIR0 = 1	(2) Set the P3OUT0 flag of the port 3 output register to "1" (H level) and the P3DIR0 flag of the port 3 direc- tion register to "1" (output mode) to output 'H' level to the SDA pin (P32).
(3) Output start condition. P3OUT (x'3F13') bp0 : P3OUT0 = 0	<ul><li>(3) Set the P3OUT0 flag of the port 3 output register to</li><li>"0" (L level) to output 'L' level (start condition) to the SDA pin.</li></ul>
(4) Set the SC2MD0 register. SC2MD0 (x'3F5A') bp7 : SC2CE0 = 1 bp6 : SC2CMD = 1 bp3-0 : SC2LNG3-0 = 0111 bp4 : SC2STE = 0 bp5 : SC2DIR = 0	<ul> <li>(4) - Set the SC2CE0 flag to "1" to set the reception data input edge to "falling".</li> <li>Set the SC2CMD flag of the SC2MD0 register to "1" to select IIC mode.</li> <li>Set SC2LNG3-0 to "0111" to set transfer bit count to 9 bits.</li> <li>Set the SC2STE flag to "0" to disable start condition.</li> <li>Set the SC2DIR flag to "0" to set first transfer bit to MSB.</li> </ul>

Setup Procedure	Description
(5) Set the SC2MD1 register. SC2MD1 (x'3F5B') bp2-0 : SC2CK2-0 = 000 bp3 : SC2SBTS = 1 bp6 : SC2SBTM = 1 bp7 : SC2SBOM = 1	<ul> <li>(5) - Set the SC2CK2-0 flags to "000" to set fs/4 as clock source.</li> <li>Set the SC2SBTS flag to "1" to set serial clock pin.</li> <li>Set the SC2SBTM flag to "1" to set N-ch opendrain.</li> <li>Set the SC2SBOM flag to "1" to set N-ch opendrain.</li> </ul>
<ul> <li>(6) Set the SC2CTR register.</li> <li>SC2CTR (x'3F5C')</li> <li>bp0 : SC2ACK0 = 1</li> <li>bp1 : SC2ACKS = 1</li> <li>bp6 : SC2IOM = 1</li> </ul>	<ul> <li>(6) - Set the SC2ACK0 flag to "1" to set the ACK bit level to "H".</li> <li>(This is the output level of the 9th data (ACK bit) at transmission.)</li> <li>Set the SC2ACKS flag to "1" to enable the ACK bit.</li> <li>Set the SC2IOM flag to "1" to set the SBO2 pin as a transmission/reception port.</li> </ul>
<ul> <li>(7) Enable serial port.</li> <li>SC2MD1 (x'3F5B')</li> <li>bp4 : SC2SBIS = 1</li> <li>bp5 : SC2SBOS = 1</li> </ul>	<ul><li>(7) Set the SC2SBIS flag and the SC2SBOS flag to "1" to enable serial port.</li></ul>
<transmission is="" started.=""> (8) Start serial data transmission. SC2TRB (x'3F5D') <transmission completed.="" is=""> (9) Judge the ACK bit. When transmission of 9 bits data (8 bits data + the ACK bit) is completed, the SC2 transfer complete interrupt occurs.</li> <li>(9) Read the SC2ACK0 flag of the SC2CTR register to judge the ACK bit.</li> </ul>
<setup data="" for="" next="" the="" transmission=""> (10) Set the SC2MD0 register. SC2MD0 (x'3F5A') bp3-0 : SC2LNG3-0 = 0111</setup>	(10) Set the SC2LNG3-0 flags to "0111" to set transfer bit count to 9 bits.
(11) Set the SC2CTR register. SC2CTR (x'3F5C') bp0 : SC2ACK0 = 1	(11) Set the SC2ACK0 flag to "1" to set the output level of the 9th bit data (ACK bit) at transmission to "H".

Setup Procedure	Description
<the data="" is="" next="" started.="" transmission=""> (12) Serial transmission is started. → Repeat from (8).</the>	(12)
<transmission completed.="" is=""> (13) Set the P3OUT register. P3OUT (x'3F13') bp2 : P3OUT2 = 0 bp0 :P3OUT0 = 0</transmission>	(13) Set the P3OUT2 flag and the P3OUT0 flag of the P3OUT register to "0".
(14) Set the SC2MD1 register. SC2MD1 (x'3F5B') bp5 : SC2SBOS = 0 bp4 : SC2SBIS = 0 bp3 : SC2SBTS = 0	<ul> <li>(14) Set the SC2SBOS flag, SC2SBIS flag and the SC2SBTS flag of the SC2MD1 register to "0" to switch the SDA pin and the SCL pin to a general port.</li> <li>'L' level is output from the SDA pin and the SCL pin.</li> </ul>
(15) Set the P3OUT register. P3OUT (x'3F13') bp2 : P3OUT2 = 1	(15) Output "H" level to the SCL pin.
(16) Set the P3OUT register. P3OUT (x'3F13') bp0 : P3OUT0 = 1	(16) Output "H" level (stop condition) to the SDA pin.

Be sure to set the SC2SBTS flag of the SC2MD1 register to "1" before setting the SC2SBOS flag and the SC2SBIS flag of the SC2MD1 register to "1".

Set the SC2CE0 flag of the SC2MD0 register to "1" before setting the SC2LNG3-0 flags of the SC2MD0 register.

Set the SC2SPKF flag, the SC2STKF flag, the SC2SPEN flag and SC2STEN flag of the SC2CTR register always to "0".

#### ■Master Reception Setup

Here is the setup example for the data reception after 1 byte transmission with IIC interface function of serial interface 2.

ltem	Set to	ltem	Set to
SBI2/SBO2 pins	Connection (with 2 channels)	Clock source	fs/4
Transfer bit count	8 bits	SCL/SDA pins' style	N-ch open-drain
Start condition	enable (without flag setup)	Pull-up resistance of the SCL pin	added
First transfer bit	MSB	Pull-up resistance of the SDA pin	added
ACK bit	enable		

Figure 12-3-16 Conditions of Single Master IIC Reception Setup

An example setup procedure, with a description of each step is shown below.

(23) Set the P3OUT register. P3OUT (x'3F13') bp2 : P3OUT2 = 1	(23) Output 'H' level to the SCL pin.
(24) Set the P3OUT register. P3OUT (x'3F13') bp0 : P3OUT0 = 1	(24) Output 'H' level (stop condition) to the SDA pin.

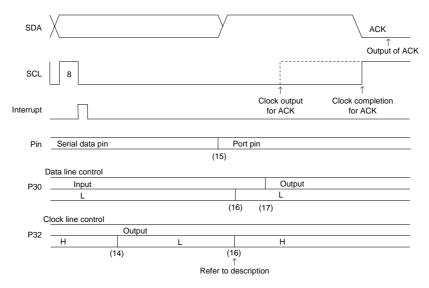

Figure 12-3-15 ACK Processing at Reception

Be sure to set the SC2SBTS flag of the SC2MD1 register to "1" before setting the SC2SBOS flag and the SC2SBIS flag of the SC2MD1 register to "1".

Set the SC2CE0 flag of the SC2MD0 register to "1" before setting the SC2LNG3-0 flags of the SC2MD0 register.

Set the SC2SPKF flag, the SC2STKF flag, the SC2SPEN flag and the SC2STEN flag of the SC2CTR register always to "0".

# Chapter 13 Automatic Transfer Controller

13

# 13-1 Overview

# 13-1-1 ATC

This LSI contains an automatic transfer controller (ATC) that uses direct memory access (DMA) to transfer the contents between the memory space and the internal special function register space using the hardware. This block is called ATC.

The special function register space means the 256 bytes of x'3F00' to x'3FFF', and the memory space means the 64 KB of x'0000' to x'FFFF'.

ATC is activated by an interrupt of trigger factor. Once this occurs, even if it is in the middle of executing an instruction, the microcontroller stops normal operation in the timing of releasing the bus, and transfers bus control to ATC. ATC then uses the released bus for the hardware data transfer.

Every time a trigger factor is generated, 1 byte or 1 word data is transferred, after the transferes are completed in numbers set in the transfer data count register, the automatic transfer control interrupt is generated.

There are seven interrupts as a trigger factor, external interrupt (IRQ0), external interrupt (IRQ1), timer 2 interrupt, timer 4 interrupt, serial interface 0 interrupt, serial interface 1 interrupt, serial interface 2 interrupt and A/D converter interrupt.

1 word transfer is the mode that trasfers 16 bit capture register data and 10 bit A/D data. The data of two serial interface addresses which starts with even address is consecutively transferred.

The interrupt enable flag (xxxIE) as a trigger factor of the interrupt need not to be set. Because the automatic data transfer occurs in the hardware without going through an interrupt service routine. If the interrupt enable flag (xxxIE) is set, a regular interrupt is generated after the automatic transfer ends.

# 13-1-2 Functions

Table 13-1-1 and 13-1-2 provide a list of the ATC trigger factors and transfer modes.

## ■ATC Trigger Factors

	External interrupt 0
	External interrupt 1
	Timer 2 interrupt
Trigger Festere	Timer 4 interrupt
Trigger Factors	Serial interface 0 interrupt
	Serial interface 1 interrupt
	Serial interface 2 interrupt
	A/D converter interrupt

## Table 13-1-1 ATC Trigger Factors

### ■ATC Transfer Modes

Table	13-1-2	Transfer	Modes
TUNIC		I I UII OI OI	mouco

Transfer Mode	Transfer unit	Data transfer target address pointer	Transfer Direction
Transfer mode 0		Fixed	Memory $\rightarrow$ Special register
Transfer mode 1	1 buto		Special register $\rightarrow$ Memory
Transfer mode 2	1 byte	Increment	Memory $\rightarrow$ Special register
Transfer mode 3			Special register $\rightarrow$ Memory
Transfer mode 4		Fixed	Memory $\rightarrow$ Special register
Transfer mode 5	1 word (2 bytes)	Fixed	Special register $\rightarrow$ Memory
Transfer mode 6		Increment	Memory $\rightarrow$ Special register
Transfer mode 7		Increment	Special register $\rightarrow$ Memory

# 13-1-3 Block Diagram

■ATC Block Diagram

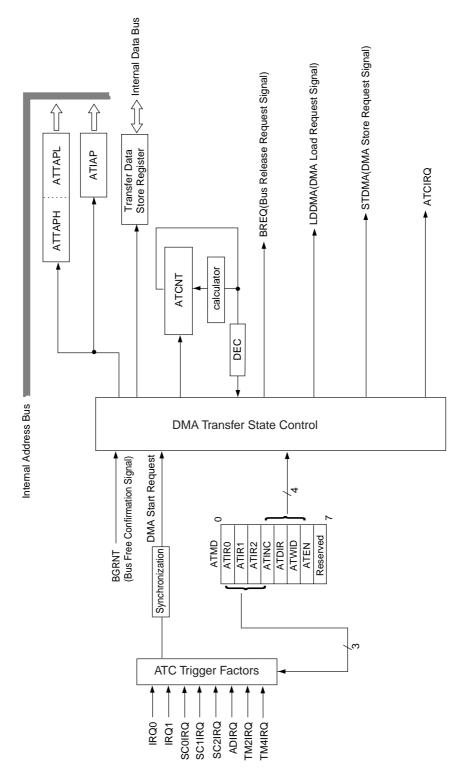

Figure 13-1-1 ATC Block Diagram

# 13-2 Control Registers

# 13-2-1 Registers List

Table 13-2-1 shows the registers used to control ATC.

	Register	Address	R/W	Function	Page
	ATMD	x'03FA0'	R/W	ATC control register	XIII - 6
	ATCNT	x'03FA1'	R/W	Transfer data counter	XIII - 7
ATC	ATTAPL	x'03FA2'	R/W	Data transfer target address pointer (lower 8 bits)	XIII - 7
	ATTAPH	x'03FA3'	R/W	Data transfer target address pointer (upper 8 bits)	XIII - 7
	ATIAP	x'03FA4'	R/W	Data transfer internal address pointer	XIII - 7

## Table 13-2-1 ATC Control Registers

R/W : Readable / Writable

## 13-2-2 Registers

### ■ATC Register (ATMD)

This readable and writable 8-bit register controls the automatic data transfer control function.

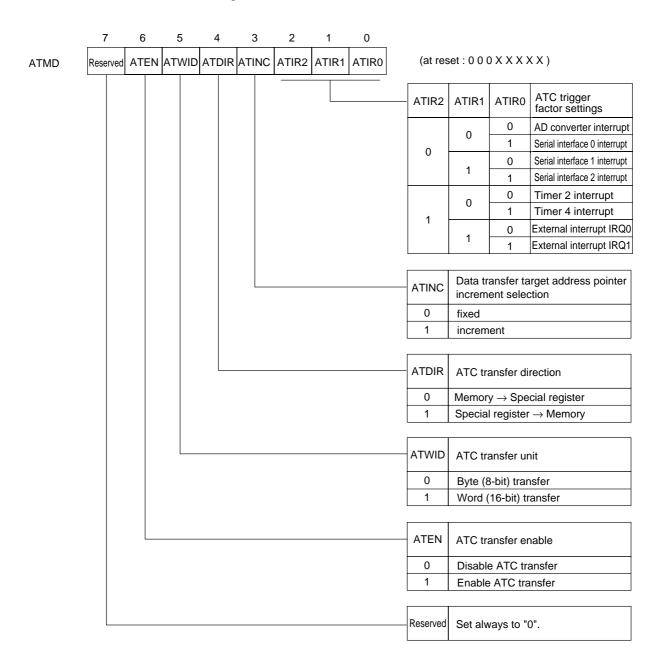

Figure 13-2-1 ATC Register (ATMD : x'03FA0', R/W)

#### ■Transfer Data Counter (ATCNT)

This 8-bit readable and writable register sets the total number of bytes of the data transfer. The contents of ATCNT are decremented (-1) at each 1 byte transfer. When the value of ATCNT reaches at x'00', an automatic data transfer interrupt (ATCIRQ) is generated, and the ATC transfer enabled flag (ATEN) is cleared to "0" to complete the transfer.

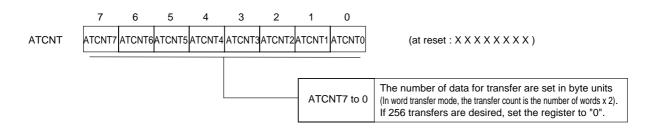

Figure 13-2-2 Transfer Data Counter (ATCNT : x'03FA1', R/W)

#### ■Data Transfer Target Address Pointer (ATTAP)

These registers are readable and writable register to specify the address of the transfer target to a memory space.

Figure 13-2-3 Data Transfer Target Address Pointer : Lower 8 bits (ATTAPL : x'03FA2', R/W)

### Figure 13-2-4 Data Transfer Target Address Pointer : Upper 8 bits (ATTAPH : x'03FA3', R/W)

#### ■Data Transfer Internal Address Pointer (ATIAP)

This register is readable and writable register to specify the address of the lower 8 bits to an internal special function register space.

# 13-3 Operation

## 13-3-1 Basic Operations and Timing

ATC1 is a DMA block that enables the hardware to transfer the entire memory space (256 KB). This section provides a description of and timing for the basic ATC1 operations.

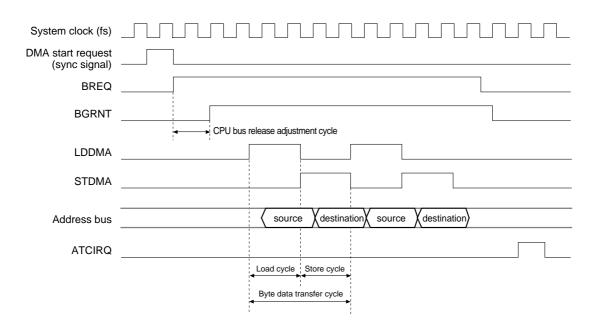

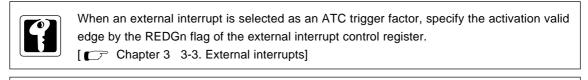

Figure 13-3-1 ATC Timing Chart

## ■ATC activation and internal bus acquisition

ATC activates when the selected interrupt factor occurs. Select the ATC trigger factor from the automatic data transfer control register (ATMD).

When ATC starts, the ATC controller asserts the BREQ signal, which requests the MCU core to release the bus. When the core receives the BREQ signal, it stops all normal executions, even if it is in the middle of executing an instruction, and releases the bus at the next available timing. The core takes a maximum of four cycles from the time it receives the BREQ signal until it actually releases the bus. After it releases the internal bus, the core returns the bus granted signal, BGRNT, to ATC. ATC can then begin using the bus to transfer data.

Set the valid edge for external interrupts before ATC activates.

#### ■Data transfer

The basic ATC operation cycle is the "byte-data transfer cycle", in which ATC1 transfers a single byte of data. This operation consists of two instruction cycles, a load and a store cycle. In the load cycle, ATC reads the data from the source address of the source memory, and in the store cycle, ATC stores the read data to the destination address of the destination memory.

ATC transfers word-length data by repeating the byte-data transfer cycle two times.

#### Transfer end

Once it has transferred all the data, ATC generates an interrupt (ATCIRQ) and stop the automatic transfer. In this way, the ATC block automatically transfers data in a continuous DMA operation without the need of software control.

In both the load and store cycles, the read and write access occurs to the memory exactly as it does in a normal instruction execution. This means that the access timing is different depending on memory space. Also, the wait settings for I/O and external memory spaces is enabled. The following is the access timing for each memory space, assuming no-wait situation.

- Internal ROM/RAM space	2 cycles
- External memory space	2 cycles
<ul> <li>I/O space (special registers)</li> </ul>	3 cycles

## 13-3-2 Setting the Memory Address

### ■Setting the transfer addresses

The address of the memory space which is automatically data-transferred by ATC should be set in the data transfer target address pointer (ATTAPH, ATTAPL) and the address of the special register should be set in the data transfer internal address pointer (ATIAP). In each transfer mode, one of those pointer is the source address, and another is the destination address.

#### Data transfer target address pointer functions

Data transfer target address pointer is comprised of two 8-bit registers, ATTAPH and ATTAPL. ATTAPH holds upper 8 bits of the 16-bit address, ATTAPL contains lower 8 bits. The 16-bit address set in the data transfer target address pointer points to a specific address in the memory space (x'0000' to x'FFFF') of 64 KB.

Data transfer target address pointer also contains a computational function that enables it to increment the address based on the transfer mode.

### Data transfer internal address pointer functions

Data transfer internal address pointer is comprised of 8-bit register, ATIAP, holds the 8-bit address. The 8-bit address set in the data transfer internal address pointer points to the address of lower 8 bits in the special register space (x'3F00' to x'3FFF').

## 13-3-3 Setting the Data Transfer Count

### ■Transfer data counter (ATCNT) function

The data transfer count is preset by ATC. Set the value in the transfer data counter (ATCNT). The transfer data counter decrements everytime when ATC transfers one byte of data.

When the counter reaches x'00' after a data transfer, ATC generates an interrupt (ATCIRQ).

The transfer counter can be set up to 256 transfers (Set x'00' to the counter.).

The value in the transfer data counter is indeterminate at reset. Initialize the ATCNT before activating ATC.

## 13-3-4 Setting the Data Transfer Modes

### ■Data transfer modes

There are eight transfer modes of ATC transfer. [ Chapter 13. 13-1-2 ATC Transfer Modes ]

Set the transfer mode in the automatic data transfer control register (ATMD).

When the transfer ends, in each transfer mode descrements the value set in the transfer data counter (ATCNT), and bus control returns to the MCU core. This operation repeats until the transfer data counter reaches x'00'. When the transfer data counter reaches x'00', ATC completes the final data transfer, then generates an interrupt (ATCIRQ).

For instance, if the initial transfer data counter value is x'05', and the ATC activation factor is set to a timer 0 interrupt, ATC is activated each time timer 0 overflows and the automatic transfer begins. After fifth data transfer (activated by fifth timer 0 overflow) is complete, the transfer counter value becomes x'00', and ATC interrupt occurs, then the ATC transfer enable flag (ATEN) is cleared to "0", and the operation ends. After this point, overflow of timer 0 do not activate ATC.

## 13-3-5 Transfer Mode 0

In transfer mode 0, ATC automatically transfers one byte of data from any memory space to the I/O space (special registers : x'3F00' - x'3FFF') every time an ATC activation request occurs.

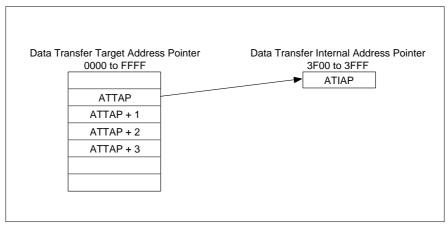

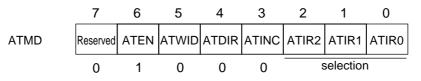

Figure 13-3-2 Transfer Mode 0

Set the source address in the 16-bit data transfer target address pointer (ATTAPH, ATTAPL), and set the destination I/O address in the data transfer internal address pointer (ATIAP). The upper bits of the I/O space address (x'03F') need not to be set in ATIAP.

Transfer mode 0 does not have an incrementing function, and executes data transfer of fixed address.

Set the data transfer count for ATC to the transfer data counter (ATCNT). Up to 256 transfers can be set to the counter. The counter decrement is occurred every time ATC is activated. When it reaches x'00', an interrupt occurs and the automatic transfer ends.

## 13-3-6 Transfer Mode 1

In transfer mode 1, ATC automatically transfers one byte of data from the I/O space (special registers : x'3F00' - x'3FFF') to any memory space every time an ATC activation request occurs.

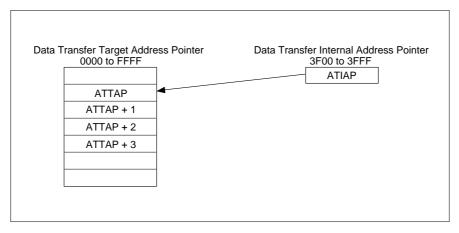

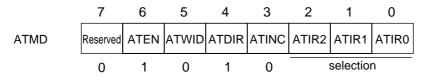

Figure 13-3-3 Transfer Mode 1

Set the source I/O address in the data transfer internal address pointer (ATIAP), and set the destination address in the 16-bit data transfer target address pointer (ATTAPH, ATTAPL). The upper bits of the I/O space address (x'03F') need not to be set in ATIAP.

Transfer mode 1 does not have an incrementing function, and executes data transfer of fixed address.

Set the data transfer count for ATC to the transfer data counter (ATCNT). Up to 256 transfers can be set to the counter. The counter decrement is occurred every time ATC is activated. When it reaches x'00', an interrupt occurs and the automatic transfer ends.

## 13-3-7 Transfer Mode 2

In transfer mode 2, ATC automatically transfers one byte of data from any memory space to the I/O space (special registers : x'3F00' - x'3FFF') every time an ATC activation request occurs.

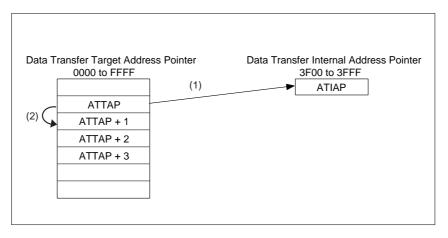

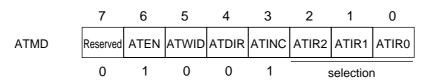

Figure 13-3-4 Transfer Mode 2

Set the source address in the 16-bit data transfer target address pointer (ATTAPH, ATTAPL), and set the destination I/O address in the data transfer internal address pointer (ATIAP). The upper bits of the I/O space address (x'03F') are need not to be set in ATIAP.

In transfer mode 2, the value in the data transfer target address pointer is incremented every time one byte-length data transfer ends. As a result, the source address for the next transfer activated by the next ATC is one address higher than that for the previous transfer.

Set the data transfer count for ATC to the transfer data counter (ATCNT). Up to 256 transfers can be set to the counter. The counter decrement is occurred every time ATC is activated. When it reaches x'00', an interrupt occurs and the automatic transfer ends.

## 13-3-8 Transfer Mode 3

In transfer mode 3, ATC automatically transfers one byte of data from the I/O space (special registers : x'3F00' - x'3FFF') to any memory space every time an ATC activation request occurs.

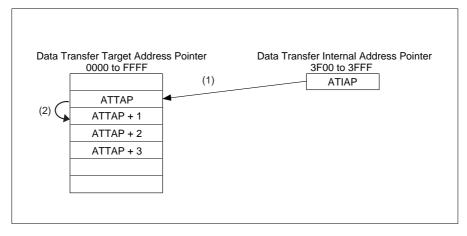

Figure 13-3-5 Transfer Mode 3

Set the source I/O address in the data transfer internal address pointer (ATIAP), and set the destination address in the 16-bit data transfer target address pointer (ATTAPH, ATTAPL). The upper bits of the I/O space address (x'03F') need not to be set in ATIAP.

In transfer mode 3, the value in the data transfer internal address pointer is incremented every time one byte-length data transfer ends. As a result, the destination address for the next transfer activated by the next ATC is one address higher than that for the previous transfer.

Set the data transfer count for ATC to the transfer data counter (ATCNT). Up to 256 transfers can be set to the counter. The counter decrement is occurred every time ATC is activated. When it reaches x'00', an interrupt occurs and the automatic transfer ends.

## 13-3-9 Transfer Mode 4

In transfer mode 4, ATC automatically transfers two bytes (one word) of data from any memory space to the I/O space (special registers : x'3F00' - x'3FFF') every time an ATC activation request occurs.

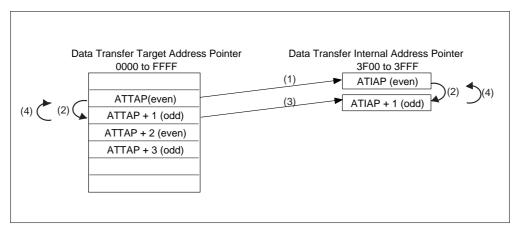

Figure 13-3-6 Transfer Mode 4

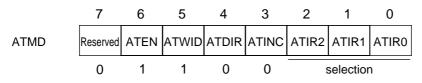

Set the source address to the 16-bit data transfer target address pointer (ATTAPH, ATTAPL), and set the destination I/O address to the data transfer internal address pointer (ATIAP). The upper bits of the I/ O space address (x'03F') need not to be set in ATIAP.

In transfer mode 4, by ATC activation, the value in the data transfer target address pointer is incremented when the first byte data transfer ends, and then is decremented when the second byte data transfer end. ATC executes the data byte transfer twice to send one data word. As a result, the source address for the next data transfer by the next ATC activation becomes the first setting address.

In this word-length transfer, ATC transfers the first data byte to an even address of the I/O space and the second data byte to an odd address in the I/O space.

Set the data transfer count for ATC in the transfer data counter (ATCNT) by increments of one byte (transfer word count x 2). The counter can be set up to 256 transfers. The counter decrements every time ATC is activated (after each word transfer). When it reaches x'00', an interrupt occurs and the automatic transfer ends.

## 13-3-10 Transfer Mode 5

In transfer mode 5, ATC automatically transfers two bytes (one word) of data from the I/O space (special registers : x'3F00' - x'3FFF') to any memory space every time an ATC activation request occurs.

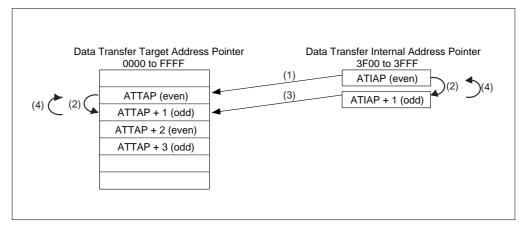

Figure 13-3-7 Transfer Mode 5

Set the source I/O address to the data transfer internal address pointer (ATIAP), and set the destination address to the 16-bit data transfer target address pointer (ATTAPH, ATTAPL). The upper bits of the I/O space address (x'03F') need not to be set in ATIAP.

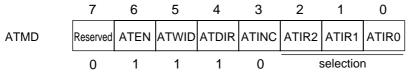

Always set an even address to the lower 8 bits of data transfer target address pointer and the data transfer internal address pointer. In one-word transferrence, ATC only transfers the even address and the consecutive odd address.

In transfer mode 5, by ATC activation, the value in the data transfer target address pointer is incremented when the first byte data transfer ends, and then is decremented when the second byte data transfer end. ATC executes the data byte transfer twice to send one data word. As a result, the source address for the next data transfer by the next ATC activation becomes the first setting address.

In this word-length transfer, ATC transfers the first data byte to an even address of the I/O space and the second data byte to an odd address in the I/O space.

Set the data transfer count for ATC in the transfer data counter (ATCNT) by increments of one byte (transfer word count x 2). The counter can be set up to 256 transfers. The counter decrements each time ATC is activated (after each word transfer). When it reaches x'00', an interrupt occurs and the automatic transfer ends.

# 13-3-11 Transfer Mode 6

In transfer mode 6, ATC automatically transfers two bytes (one word) of data from any memory space to the I/O space (special registers : x'3F00' - x'3FFF') every time an ATC activation request occurs.

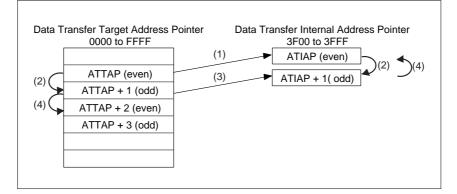

Figure 13-3-8 Transfer Mode 6

Set the source address to 16-bit data transfer target address pointer (ATTAPH, ATTAPL), and set the destination I/O address to the data transfer internal address pointer (ATIAP). The upper bits of the I/O space address (x'03F') need not to be set in ATIAP.

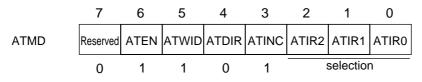

Always set an even address to the lower 8 bits of data transfer target address pointer and the data transfer internal address pointer. In one-word transferrence, ATC only transfers the even address and the consecutive odd address.

In transfer mode 6, by ATC activation, the value in the data transfer target address pointer is incremented every time one byte-length data transfer ends. ATC executes a data byte transfer twice, to send one data word. As a result, the source address for the next data transfer by the next ATC activation is two addresses higher than that for the previous operation.

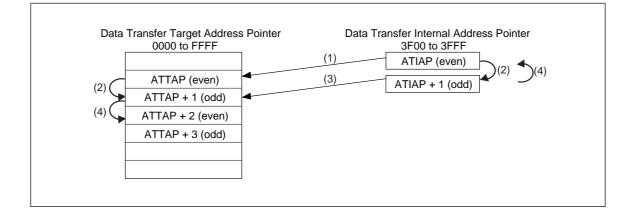

In this word-length transfer, ATC transfers the first data byte to an even address of the I/O space and the second data byte to an odd address in the I/O space.

Set the data transfer count for ATC in the transfer data counter (ATCNT) by increments of one byte (transfer word count x 2). The counter can be set up to 256 transfers. The counter decrements each time ATC is activated (after each word transfer). When it reaches x'00', an interrupt occurs and the automatic transfer ends.

## 13-3-12 Transfer Mode 7

In transfer mode 7, ATC automatically transfers two bytes (one word) of data to any memory space from the I/O space (special registers : x'03F00' - x'03FFF') every time an ATC activation request occurs.

#### Figure 13-3-9 Transfer Mode 7

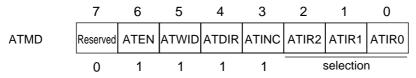

Set the source I/O address to the data transfer internal address pointer (ATIAP), and set the destination address to the 16-bit data transfer target address pointer (ATTAPH, ATTAPL). The upper bits of the I/O space address (x'03F') need not to be set in ATIAP.

Always set an even address in the lower 8 bits of data transfer target address pointer and the data transfer internal address pointer. In one-word transferrence, ATC only transfers the even address and the consecutive odd address.

In transfer mode 7, by ATC activation, the value in the data transfer target address pointer is incremented every time one byte-length data transfer ends. ATC executes a data byte transfer twice, to send one data word. As a result, the destination address for the next data transfer by the next ATC activation is two addresses higher than that for the previous operation.

In this word-length transfer, ATC transfers the first data byte from an even address of the I/O space and the second data byte from an odd address in the I/O space.

Set the data transfer count for ATC in the transfer data counter (ATCNT) by increments of one byte (transfer word count x 2). The counter can be set up to 256 transfers. The counter decrements each time ATC is activated (after each word transfer). When it reaches x'00', an interrupt occurs and the automatic transfer ends.

# 13-3-13 Setup Example

An example setup procedure, with a description of each step is as follows ;

Setup Procedure	Description
<ul><li>(1) Disable ATC operation.</li><li>ATMD (x'3FA0')</li><li>bp6 :ATEN = 0</li></ul>	<ol> <li>Disable ATC operation by the ATEN flag of the ATMD register.</li> </ol>
<ul> <li>Set the data transfer mode.</li> <li>Select the trigger factor.</li> <li>ATMD (x'3FA0')</li> <li>bp2-0 :ATIR2-0</li> </ul>	(2) Select the trigger factor by the ATIR2 - 0 flag of the ATMD register.
Set the data transfer target address to the increment mode. ATMD (x'3FA0') bp3 :ATINC	Set the data transfer target address to the increment mode by the ATINC flag of the ATMD register.
Select the transfer format. ATMD (x'3FA0') bp5 :ATWID	Select the transfer format by the ATWID flag of the ATMD register.
Select the transfer direction. ATMD (x'3FA0') bp4 :ATDIR	Select the transfer direction by the ATDIR flag of the ATMD register.
(3) Set the transfer data count. ATCNT (x'3FA1')	(3) Set the ATC data transfer data count in the ATCNT register.
<ul><li>(4) Set the data transfer target address pointer.</li><li>ATTAP (x'3FA3, x'3FA2')</li></ul>	(4) Set the data transfer target address pointer in the ATTAP register.
<ul><li>(5) Set the data transfer internal address pointer.</li><li>ATIAP (x'3FA4')</li></ul>	(5) Set the data transfer internal address pointer in the ATIAP register.

Setup Procedure	Description
<ul><li>(6) Enable ATC operation.</li><li>ATMD (x'3FA0')</li><li>bp6 :ATEN = 1</li></ul>	(6) Enable ATC data transfers with the ATEN flag of the ATMD register.

The transfer is started when the trigger factor set in (3) is generated.

After the transfer ends, the automatic data transfer interrupt (ATCIRQ) is generated. And at the same time, the ATEN flag of the ATMD register is cleared to "0".

# 14-1 Overview

This LSI has an A/D converter with 10 bits resolution. That has a built-in sample hold circuit, and the analog input can be switched channel 0 to 7 (AN0 to AN7). As A/D converter is stopped, the power consumption can be reduced by a built-in ladder resistance.

## 14-1-1 Functions

Table 14-1-1 shows the A/D converter functions.

A/D input pins	8 pins
Pins	AN7 to AN0
Interrupt	ADIRQ
Resolution	10 bits
Conversion time (min.)	9.6 μs (as Tad =800 ns)
Input range	VREF- to VREF+
Power consumption	Built-in ladder resistance (ON/OFF)

### Table 14-1-1 A/D Converter Functions

Keep reference voltage between VREF+ and VREF- above 2 V.

## 14-1-2 Block Diagram

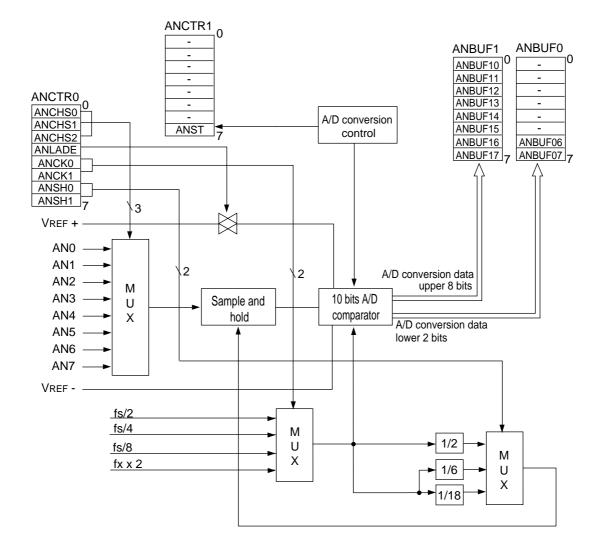

Figure 14-1-1 A/D Converter Block Diagram

# 14-2 Control Registers

A/D converter consists of the control register (ANCTRn) and the data storage buffer (ANBUFn).

# 14-2-1 Registers

Table 14-2-1 shows the registers used to control A/D converter.

			-	
Register	Address	R/W	Function	Page
ANCTR0	x'03F90'	R/W	A/D converter control register 0	XIV - 5
ANCTR1	x'03F91'	R/W	A/D converter control register 1	XIV - 6
ANBUF0	x'03F92'	R	A/D buffer 0	XIV - 7
ANBUF1	x'03F93'	R	A/D buffer 1	XIV - 7
ADICR	x'03FEA'	R/W	A/D converter interrupt control register	Ⅲ - 32
PAIMD	x'03F3A'	R/W	Port A input mode register	IV - 46
PAPLUD	x'03F4A'	R/W	Port A pull-up/pull-down resistance control register	

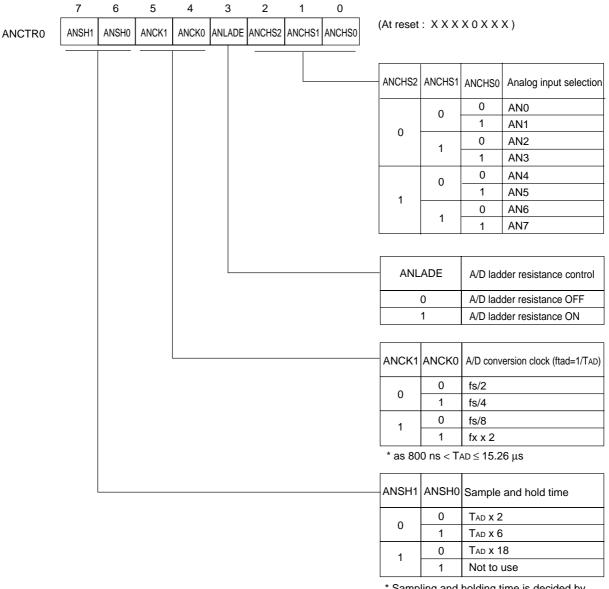

#### Table 14-2-1 A/D Converter Control Registers

R/W : Readable/Writable

R : Readable only

## 14-2-2 Control Registers

■A/D Converter Control Register 0 (ANCTR0)

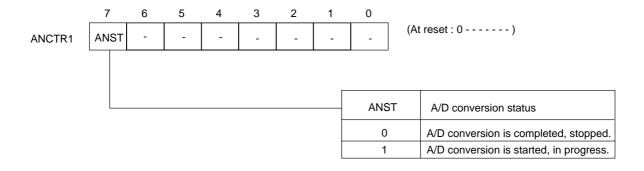

\* Sampling and holding time is decided by the input impedance at analog input.

TAD means the cycle for A/D conversion clock.

## ■A/D Converter Control Register 1 (ANCTR1)

## 14-2-3 A/D Buffers

## They are reading only registers that stores result of A/D conversion.

### ■A/D Buffer 0 (ANBUF0)

The lower 2 bits from the result of A/D conversion are stored to this register.

## Figure 14-2-3 A/D Buffer 0 (ANBUF0 : x'03F92', R)

■A/D Buffer 1 (ANBUF1)

The upper 8 bits from the result of A/D conversion are stored to this register.

Figure 14-2-4 A/D Buffer 1 (ANBUF1 : x'03F93', R)

# 14-3 Operation

Here is a description of A/D converter circuit setup procedure.

(1) Set the analog pins.

Set the analog input pin, set in (2), to "special function pin" by the port A input mode register (PAIMD).

# \* Setup for the port A input mode register should be done before analog voltage is put to pins.

(2) Select the analog input pin.

Select the analog input pin from AN7 to AN0 (PA7 to PA0) by the ANCHS2 to ANCHS0 flag of the A/D converter control register 0 (ANCTR0).

(3) Select the A/D converter clock. Select the A/D converter clock by the ANCK1, ANCK0 flag of the A/D converter control register 0 (ANCTR0).

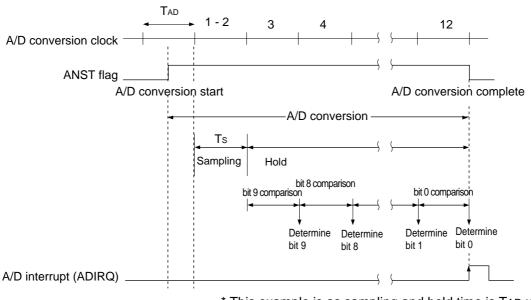

Keep the converter clock (TAD) under 800 ns with a resonator.

- Set the sample hold time.
   Set the sample hold time by the ANSH1, ANSH0 flag of the A/D converter control register 0 (ANCTR0). The sample hold time should be based on analog input impedance.
- (5) Set the A/D ladder resistance.
   Set the ANLADE flag of the A/D converter control register 0 (ANCTR0) to "1", and a current flow through the ladder resistance and A/D converter goes into the waiting.
   \* (2) to (5) are not in order. (3), (4) and (5) can be operated simultaneously.
- (6) Start the A/D conversion. Set the ANST flag of the A/D converter control register 1 (ANCTR1) to "1" to start A/D converter.
- (7) A/D conversion

Each bit of the A/D buffer 0, 1 is generated after sampled in the sample and hold time set in (3). Each bit is generated in sequence from MSB to LSB.

(8) Complete the A/D conversion.

When A/D conversion has finished, the ANST flag is cleared to "0", and the result of the conversion is stored to the A/D buffer (ANBUF0, 1). At the same time, the A/D complete interrupt request (ADIRQ) is generated.

\* This example is as sampling and hold time is TAD x 2.

Figure 14-3-1 Operation of A/D Conversion

To read the value of the A/D conversion, A/D conversion should be done several times to prevent noise error by confirming the match of level by program, or by using the average value.

## 14-3-1 Setup

### ■Input Pins of A/D Converter Setup

Input pins for A/D converter is selected by the ANCH2 to 0 flag of the ANCTR0 register.

ANCHS2	ANCHS1	ANCHS0	A/D pin
	0	0	AN0 pin
0	0	1	AN1 pin
1	1	0	AN2 pin
		1	AN3 pin
	0	0	AN4 pin
1		1	AN5 pin
		0	AN6 pin
		1	AN7 pin

 Table 14-3-1
 Input Pins of A/D Converter Setup

■Clock of A/D Converter Setup

The A/D converter clock is set by the ANCK1 to 0 flag of the ANCTR0 register. Set the A/D converter clock (TAD) more than 800 ns and less than 15.26  $\mu$ s. Table 14-3-2 shows the machine clock (fosc, fx, fs) and the A/D converter clock (TAD). (calculated as fs = fosc/2, fx/4)

	ANCK0	A/D conversion clock	A/D conversion cycle (TAD)		
ANCK1			at oscillation for high speed		at oscillation for low speed
			at fosc=20 MHz	at fosc=8.38 MHz	at fx=32.768 kHz
0	0	fs/2	200.00 ns (unusable)	477.33 ns (unusable )	244.14 µs (unusable )
	1	fs/4	400.00ns (unusable)	954.65ns	488.28 µs (unusable )
1	0	fs/8	800.00 ns	1.91 µs	976.56 µs (unusable )
	1	fx x 2	15.26 µs	15.26 µs	15.26 µs

■Sampling Time (Ts) of A/D Converter Setup

The sampling time of A/D converter is set by the ANSH1 to 0 flag of the ANCTR0 register. The sampling time of A/D converter depends on external circuit, so set the right value by analog input impedance.

 Table 14-3-3
 Sampling Time of A/D Conversion and A/D Conversion Time

ANSH1	ANSH0	Sampling time (Ts)	A/D conversion time			
			at TAD=800 ns	at TAD=954.65 ns	at TAD=1.91 µs	at TAD=15.26 µs
0	0	Tad x 2	9.60 µs	11.46 µs	22.92 µs	183.12 µs
0	1	Tad x 6	12.80 µs	15.27 µs	30.56 µs	244.16 µs
4	0	Tad x 18	22.40 µs	26.73 µs	53.48 µs	427.28 µs
	1	Reserved	-	-	-	-

## ■Built-in Ladder Resistor Control

The ANLADE flag of the ANCTR0 register is set to "1" to send a current to the ladder resistance for A/ D conversion. As A/D converter is stopped, the ANLADE flag of the ANCTR0 register is set to "0" to save the power consumption.

ANLADE	A/D ladder resistance control
0	A/D ladder resistance OFF (A/D conversion stopped)
1	A/D ladder resistance ON (A/D conversion stopped)

Table 14-3-4 A/D Ladder Resistor Control

### ■A/D Conversion Starting Setup

A/D conversion starting is set by the ANST flag of the ANCTR1 register. The ANST flag of the ANCTR1 register is set to "1" to start A/D conversion. Also, the ANST flag of the ANCTR1 register is set to "1" during A/D conversion, then cleared to "0" as the A/D conversion complete interrupt is generated.

Table 14-3-5	A/D Conversion Starting
--------------	-------------------------

ANST	A/D conversion status
1	A/D conversion started or in progress.
0	A/D conversion completed or stopped.

# 14-3-2 Setup Example

### ■A/D Converter Setup Example by Registers

A/D conversion is started by setting registers. The analog input pins are set to AN0, the converter clock is set to fs/4, and the sampling hold time is set to TAD x 6. Then, A/D conversion complete interrupt is generated.

An example setup procedure, with a description of each step is shown below.

Setup Procedure	Description		
<ul> <li>(1) Set the analog input pin.</li> <li>PAIMD (x'3F3A')</li> <li>bp0 : PAIMD0 = 1</li> <li>PAPLUD (x'3F4A')</li> <li>bp0 : PAPLUD0 = 0</li> </ul>	(1) Set the analog input pin, set in (2), to the special function pin by the port A input mode register (PAIMD). Also, set no pull-up/pull-down resistance by the port A pull-up/pull-down resistance control register (PAPLUD).		
<ul><li>(2) Select the analog input pin.</li><li>ANCTR0 (x'3F90')</li><li>bp2-0 : ANCHS2-0 = 000</li></ul>	(2) Set the AN0 (PA0) to the analog input pin by setting the ANCHS2-0 flag of the A/D converter control register 0 (ANCTR0) to "000".		
<ul><li>(3) Select the A/D converter clock.</li><li>ANCTR0 (x'3F90')</li><li>bp5-4 : ANCK1-0 = 01</li></ul>	(3) Set the fs/4 to the A/D converter clock by setting the ANCK1, ANCK0 flag of the A/D converter control register 0 (ANCTR0) to "01".		
<ul><li>(4) Set the sample and hold time.</li><li>ANCTR0 (x'3F90')</li><li>bp7-6 : ANSH1-0 = 01</li></ul>	(4) Set the TAD x 6 to the sample and hold time by setting the ANSH1, ANSH0 flag of the A/D converter control register 0 (ANCTR0) to "01".		
<ul><li>(5) Set the interrupt level.</li><li>ADICR (x'3FEA')</li><li>bp7-6 : ADLV1-0 = 00</li></ul>	<ul> <li>(5) Set the interrupt level by the ADLV1-0 flag of the A/D conversion complete interrupt control register (ADICR). If any interrupt request flag had already been set, clear it.</li> <li>[ C&gt;P Chapter 3. 3-1-4 Interrupt Flag Setting ]</li> </ul>		
<ul><li>(6) Enable the interrupt.</li><li>ADICR (x'3FEA')</li><li>bp1 : ADIE = 1</li></ul>	(6) Enable the interrupt by setting the ADIE flag of the ADICR register to "1".		
<ul><li>(7) Set the A/D ladder resistance.</li><li>ANCTR0 (x'3F90')</li><li>bp3 : ANLADE = 1</li></ul>	(7) Set the ANLADE flag of the A/D converter control register 0 (ANCTR0) to "1" to send a current to the ladder resistance for the A/D conversion.		

	Setup Procedure		Description
(8)	Start the A/D conversion. ANCTR1 (x'3F91') bp7 : ANST = 1	(8)	Set the ANST flag of the A/D converter control register 1 (ANCTR1) to "1" to start the A/D conversion.
(9)	Complete the A/D conversion. ANBUF0 (x'3F92') ANBUF1 (x'3F93')	(9)	When the A/D conversion has finished, the A/D conversion complete interrupt is generated and the ANST flag of the A/D converter control register 1 (ANCTR1) is cleared to "0". The result of the conversion is stored to the A/D converter buffer (ANBUF0, 1).

Note : The above (2) to (4) can be set at once.

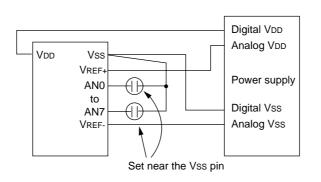

Start the A/D conversion after the current flowing through the ladder resistors stabilizes. The wait time should be decided by the calculated time from the ladder resistance (max. 80 k $\Omega$ ) and the external bypass capacitor connected between V<sub>REF+</sub> and V<sub>REF-</sub>.

## 14-3-3 Cautions

Since conversion can be damaged by noise easily, antinoise measures are necessary.

#### ■Antinoise measures

For A/D input (analog input pin), add condenser near the Vss pins of micro controller.

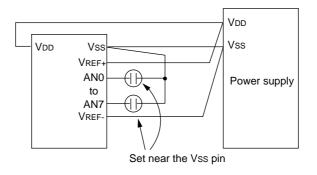

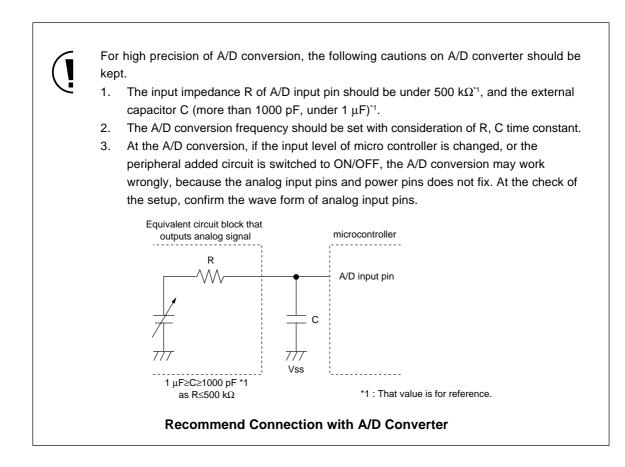

Figure 14-3-3 A/D Converter Recommended Example 2

# 15-1 EPROM Version

## 15-1-1 Overview

EPROM version is microcomputer which was replaced the mask ROM of the MN101C51F with an electronically programmable EPROM. We offer MN101CP28LAL and PX-AP101C28-FAC for MN101C51F.

The MN101CP28LAL is sealed in plastic. Once data is written to the internal EPROM, it cannot be erased. The PX-AP101C28-FAC is sealed in a ceramic package with a window. Written data can be erased by exposing the physical chip to intense ultraviolet radiation. We offer the PX-AP101C28-FAC for a 80-pin flat package.

Setting the EPROM version to EPROM mode, functions as a microcomputer are halted, and the internal EPROM can be programmed. For EPROM mode pin connection, refer to figure 15-1-2, Programming Adapter Connection.

The specification for writing to the internal EPROM are the same as for a general-purpose 1 M-bit EPROM ( $V_{PP}$ =12.5 V, tpw=0.2 ms). Therefore, by using a dedicated programming adapter (supplied by Panasonic) which can convert the 80 pin of the EPROM version to the 32 pin which has the same configuration as a normal EPROM, a general-purpose ROM writer can be used to perform read and write operations.

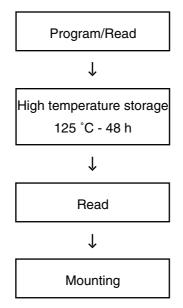

The EPROM Version is described on the following items :

- Cautions on use of the internal EPROM
- Erasing Data in Windowed Package (PX-AP101C28-FAC)
- Differences between mask ROM version and EPROM version
- Writing to the Microcomputer with internal EPROM
- Cautions on handling a ROM writer
- Programming Adapter Connection
- Option bit

### 15-1-2 Cautions on Use

EPROM Version differs from the MN101C51F Mask ROM Version in some of its electrical characteristics. The user should be aware of the following cautions :

- To prevent data from being erased by ultraviolet light after a program is written, affix seals impermeable to UV rays to the glass sections at the top and side sections of the CPU. (PX-AP101C28-FAC)
- (2) Because of device characteristics of the MN101CP28LAL, a writing test cannot be performed on all bits. Therefore, the reliability of data writing may not be 100% ensured.
- (3) When a program is being written, be sure that V<sub>DD</sub> power supply (6 V) is connected before applying the V<sub>PP</sub> power supply (12.5 V). Disconnect the V<sub>PP</sub> supply before disconnecting the V<sub>DD</sub> supply.
- (4) VPP should never exceed 13.5 V including overshoot.
- (5) If a device is removed while a VPP of +12.5 V is applied, device reliability may be damaged.
- (6) At NCE=VIL, do not change Vpp from VIL to +12.5 V or from +12.5 V to VIL.
- (7) After a program is written, screening at a high temperature storage before mounting is recommended.

# 15-1-3 Erasing Data in Windowed Package (PX-AP101C28-FAC)

To erase data of an internal EPROM with windowed packaging ("0"  $\rightarrow$  "1"), UV light at 253.7 nm is used to irradiate the chip through a permeable cover.

The recommended exposure is 10 W·s/cm<sup>2</sup>. This coverage can be achieved by using a commercial UV lamp positioned 2 to 3 cm above the package for 14 - 20 minutes ( when the illumination intensity of the package surface is 12000  $\mu$ W/cm<sup>2</sup>). Remove any filters attached to the lamp. With a mirrored reflector plate to the lamp, illumination intensity will increase 1.4 to 1.8 times, and decrease the erasure time.

If the window becomes dirty with oil, adhesive, etc., UV light permeability will get worse, causing the erasure time to increase. If this happens, clean with alcohol or another solvent that will not harm the package. The above recommended exposure has enough leeway, with several times as much as it takes to erase all the bits. It is based on the reliable data over all temperature and voltage. The lump and the level of illumination should be regularly checked and well controlled.

Data in internal EPROM with windowed packaging is erased by applying a light that the wavelength is shorter than 400 nm. Fluorescent lamp and sunlight are not able to erase data as much as UV light of 253.7 nm is, but those light sources are also able to erase data more or less. To expose those light sources for a long while can damage its system. To prevent this, cover the window with an opaque label.

If the wavelength is longer than 400 nm to 500 nm, data can not be erased. However, because of typical semiconductor characteristics, the circuit may malfunction if the chip is exposed to an extremely high illumination intensity. The chip will operate normally if this exposure is stopped. However, for areas where it is continuous, take necessary precautions against the light that the wavelength is longer than 400 nm.

## 15-1-4 Differences between Mask ROM version and EPROM version

The differences between the 8-bit microcomputer MN101C51F (Mask ROM version) and MN101CP28LAL (internal EPROM version) are as follows ;

	MN101C51F (Mask ROM version)	MN101CP28LAL (EPROM version)				
Operating voltage	$ \begin{array}{llllllllllllllllllllllllllllllllllll$					
Pin DC Characteristics	Output current, input current and input judge level are the same.					
Option bits (Settings for	ROM option	EPROM option				
operating mode after reset and watchdog timer frequency) [ Chapter 1 1-6. Option]	- Data x'1BFFF for EPROM o setting is used as option dat Write x'FF to x'1BFFF' to pro same features of MN101C57 (Mask ROM version).					
Oscillation characteristics	The combination of oscillator and each version should be estimated to match when EPROM version is changed to Mask ROM version for mass production.					
Noise characteristics	EMC check should be done on each v changed to Mask ROM version for ma					

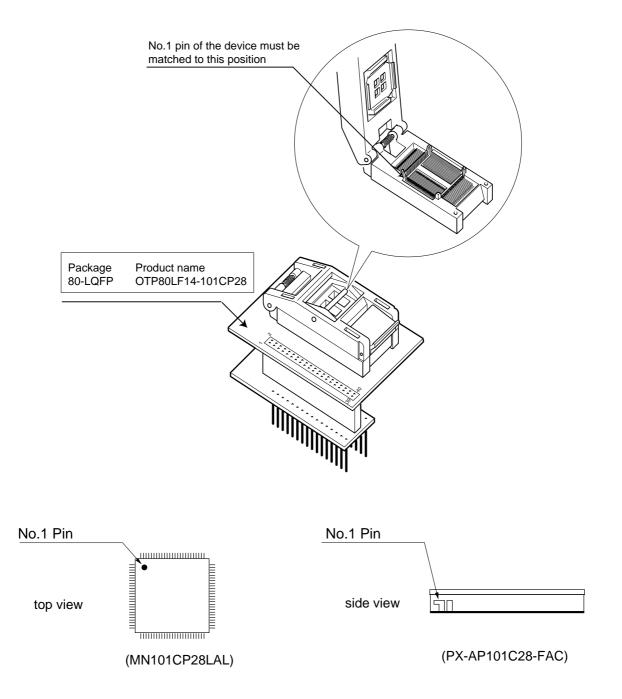

Table 15-1-1 Differences between Mask ROM version and internal EPROM version

There are no other functional differences.

## 15-1-5 Writing to Microcomputer with Internal EPROM

The device type that set by each ROM writer should be selected the mode for writing 1 M-bit EPROM. Set the writing voltage to 12.5 V.

■Mounting the device in the programming adapter and the position of the No.1 pin.

#### ■ROM Writer Setup

The device types should be set up as listed below.

Equip. name	Vendor	Device type	Remarks
Pecker30	Aval Data	Hitachi 27C101	
Peckersu	Avar Dala	Mitsubishi 27C101	
10004	Minato Electronics	Hitachi 27C101	
1890A	Minato Electronics	Mitsubishi 27C101	
2000		Hitachi 27C101	Do not run ID check.
2900	Data I/O	Mitsubishi 27C101	
Chipl ch		Hitachi 27C101	Do not run ID check and pin connection
ChipLab	Data I/O	Mitsubishi 27C101	inspection.

Table 15-1-2 Setup for Device Type	Table 15-1-2	Setup for Device Typ	эe
------------------------------------	--------------	----------------------	----

The above table is based on the standard samples.

Please contact the nearest semiconductor design center (Refer to the sales office table attached at the end of the manual), when you use the other equipment.

# 15-1-6 Cautions on Operation of ROM Writer

#### ■Cautions on Handling the ROM writer

(1) The  $V_{PP}$  programming voltage for the EPROM versions is 12.5 V.

Programming with a 21 V ROM writer can lead to damage. The ROM writer specifications must match those for standard 1 M-bit EPROM :  $V_{PP}=12.5 \text{ V}$ ; tpw=0.2 ms.

- (2) Make sure that the socket adapter matches the ROM writer socket and that the chip is correctly mounted in the socket adapter. Faulty connections can damage the chip.
- (3) After clearing all memory of the ROM writer, load the program to the ROM writer.
- (4) After confirming the device type, write the loaded program in (3) to this LSI address, from x'4000' to the final address of the internal ROM.
- (5) There is the same address for ROM option setting, even on EPROM version.

[ C Chapter 15 1-8. Option Bit ]

The internal ROM space of this LSI is from x'4000'. [  $\square$  Chapter 2 2-2. Memory Space ]

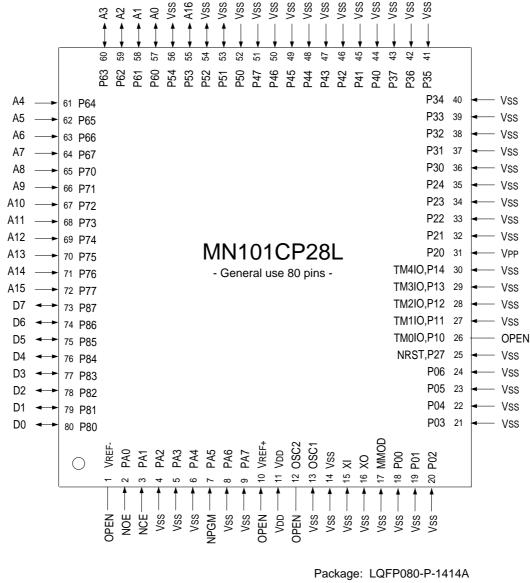

This writer has no internal ID codes of "Silicon Signature" and "Intelligent Identifier" of the auto-device selection command of ROM writer. If the auto-device selection command is to be executed for this writer, the device is likely damaged. Therefore, never use this command.

#### ■When the writing is disabled

When the writing is disabled, check the following points.

- (1) Check that the device is mounted correctly on the socket (pin bending, connection failure).
- (2) Check that the erase check result is no problem.
- (3) Check that the adapter type is identical to the device name.
- (4) Check that the writing mode is set correctly.
- (5) Check that the data is correctly transferred to the ROM writer.
- (6) Recheck the check points (1) to (5) provided on the above paragraph of 'Cautions on Handling the ROM writer'.

Please contact the nearest semiconductor design center (See the attached sales office table.), when the writing is disabled even after the above check points are confirmed and the device is replaced with another one.

## 15-1-7 Programming Adapter Connection

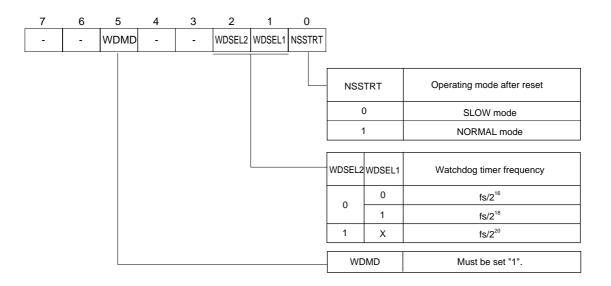

Package: LQFP080-P-1414A Pin pitch: 0.65 mm

## 15-1-8 Option Bit

MN101CP28LAL has EPROM option address to specify the operating mode after reset and the watchdog timer frequency.

■EPROM Option Bits

EPROM option address differs depending upon the model.

Model	EPROM option address
MN101CP28LAL	x'1BFFF'

Even if SLOW mode is selected after reset, connect oscillator pins as well as to the high speed oscillation input.

The WDMD (bp5) should be always set to "1". If it is set to "0", that operation cannot be stopped after the watchdog timer is started.

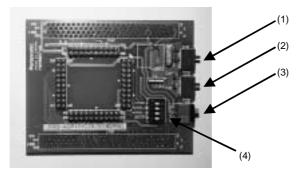

The MN101C51F (Mask Rom version) has no option. To select the same options as the MN101C51F (mode after reset : NORMAL, watchdog timer frequency : fs/2<sup>20</sup>), write x'FF to the EPROM option address x'1BFFF'.

# 15-2 Probe Switches (PRB-ADP101C28/51(80 pin))

Adapter boards differ depending upon the models. This adapter board can be used for only 101C28/51 (80 PIN). Use this adapter board with EV board, PRB-EV101C15. Improper matching may cause any damage to the ICE. The switches that the adapter board provides for configuring the probe are described below.

#### Adapter Board Layout

- (1)SW1 (Oscillator control) : Set this switch to its USR position to drive the in-circuit emulator with the oscillator built into the target device. If there is no target device, set this switch to the ICE position to use the oscillator built into the probe.
- (2)SW2 (XI control) : Set this switch to its USR position to drive the in-circuit emulator with the XI oscillator built into the target device. If there is no target device, set this switch to the ICE position to use oscillator built into the probe.
- (3)SW3 (Power supply control)
  - : Set this switch to its USR position to use the power supply from the target device. If there is no target device, set this switch to the ICE position to use the 5 V power supply from the in-circuit emulator.

#### (4)Function control DIP switches

: Each model has different setting of DIPSW as described below.

- (LCDSEL)
- ON : For models which use LCD function.
- OFF : For models which use LED function.

(WDSELI, WDSELZ) Switches for watchdog timer frequency	(WDSEL1, WDSEL2)	Switches for watchdog timer frequency
--	------------------	---------------------------------------

Pin's :	setting	Watabdag timor fraguanay
WDSEL1	WDSEL2	Watchdog timer frequency
OFF OFF		fosc/2 <sup>17</sup>
ON	OFF	fosc/2 <sup>19</sup>
Don't care	ON	fosc/2 <sup>21</sup>

(SSTRT)

Switch for oscillation control at reset released.

ON : Start with the low speed (XI) oscillation.

OFF : Start with the high speed (OSC) oscillation.
